PRESTON

FLOATING DIFFERENTIAL
Highest Performance with

8300 XWB Series Floating Differential Instrumentation Amplifiers.

Preston's amplifiers deliver precision many times better than any other amplifier! Our "Balanced Precision" 8300 XWB Series have greatly improved performance to overcome the FOUR major sources of instrumentation amplifier errors!

COMMON MODE REJECTION—Preston's CMR of 150 db at DC and 130 db at 60 Hz reduces errors by a factor of 3 to 10 times over the "next best" amplifier!

TEMPERATURE STABILITY—Preston is 2 to 5 times better with a Gain TC of only 10 ppm/°C and Zero Shift of less than 0.1uV/°C RTI!

PUMPOUT CURRENT—10 times better! Stays under ½ nanoamp over the entire temperature operating range!

OVERLOAD RECOVERY—10 times as fast! Recovers to within 0.01% in 30 usec!

The 8300 XWB Series gives you many combinations of ACCURACY, LINEARITY and BANDWIDTH from which to choose, and every model has its own integral power supply and mounts in standard RETMA racks.

For complete information on the entire line of Preston instrumentation amplifiers, request your copies of our technical literature and our 12 page "Balanced Precision" brochure that shows how to determine the true performance of your instrumentation system.

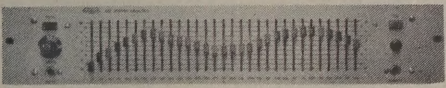
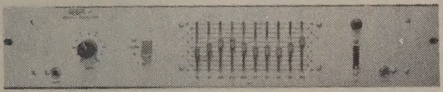
GRAPHIC EQUALIZERS



MODEL 231 —
THIRTY ONE ⅓ OCTAVE

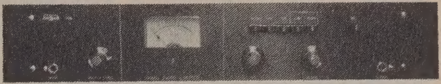


MODEL 213 —
TEN OCTAVE

Both cover the entire audio spectrum and permit complete control of spectral balance. Both models are normally used with unity gain, input to output.

The Optro Model 213 offers 10 in-line, linear controls to control boost or cut-off for each octave. A filter in/out key enables a preset equalization to be switched in or out for specific program requirements. An input level control effects overall gain.

In the Model 231 thirty one in-line slide controls control boost or cut of each ⅓rd octave. A filter in/out key enables preset equalization to be switched in or out for particular programs. The Model 231 is probably the most flexible graphic equalizer — providing detailed emphasis or de-emphasis of even small sound spectrum segments.



The Dual Band Limiter-Compressor operates over two independent bands, one below and the other above 300 Hz. The independent release times in each band prevent high level low frequency signals modulating the audio level in the other band.

A long release time is provided in the low band to prevent signal distortion whilst it is possible to maintain a shorter release time in the high band.

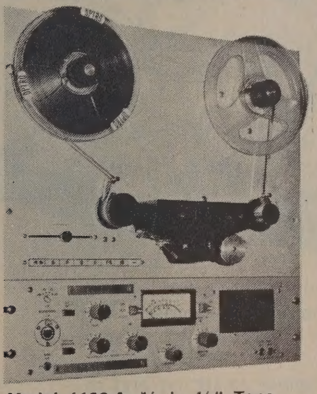
This system ensures a more balanced sound whilst maintaining a constant high level of modulation.

The Model 740 Audio Processor combines a microphone amplifier, a limiter compressor, an audio gate, a graphic equalizer and a line drive amplifier in one compact rack package.

Taking only 3½″ of rack space, the Audio Processor is one of the most versatile and useful units to become available to the professional audio engineer.

Overall frequency response is 30 - 15 kHz. ±0.5 dB. The unit contains its own regulated power supplies with overcurrent protection.

MULTI-CHANNEL MAGNETIC TAPE RECORDERS



Model 1100-A: ¼ to ½″ Tape
Model 1100-B: ½ to 1″ Tape

With configurations ranging from 1 to 32 track, the 1000 & 1100 Series handles ½, ¼, 1, 2, & 3 tape on spools of up to 14″ diameter. The basic layout consists of a console or rack mounted tape transport with power supplies and track amplifiers. The tape transport itself consists of a precision machined aluminum plate on which all components, including the solid state control box, are mounted. Servo control of the spooling motors provides constant tape tension from start to finish of the reel, smooth tape handling being assured by a direction sensed dynamic braking system. Disc brakes are provided as holding brakes when the transport is stationary. The servo capstan motor is crystal-locked, providing absolutely steady tape drive. Headblocks are plug in and quickly interchangeable, and incorporate all equalization components, enabling instant change of head format and equalization. Record bias frequency is crystal-locked. Although push button selectable 3 speeds (7½, 15 and 30 i.p.s.) are standard, an inbuilt vari-speed facility permits continuous variation from 7½ to 30 i.p.s.

These decks are a professional user's dream; they are robust, reliable and efficient. Designed for heavy duty, continuous use, they are typical of the New Era range being marketed by IEM.

- **Tape Speed:** 7.5, 15, or 30 i.p.s. Also vari-speed from 7.5 to 30 i.p.s.
- **Replay response** (at 15 i.p.s.): ±1 dB 30 Hz to 15 kHz.
- **Overall response** (at 15 i.p.s.): ±2 dB 30 Hz to 15 kHz.
- **Noise:** Better than 68 dB below peak record level.
- **Distortion:** Less than 2.5% T.H.D. at peak record level. (Peak record level is equivalent to 54 mM/mm track width.)
- **Distortion:** Less than 1% T.H.D. at normal record level.
- Crosstalk: Better than 50 dB between adjacent tracks.
- **Wow and flutter:** Less than 0.07% R.M.S. in the band 0.5 Hz to 250 Hz.
- **Input impedance:** 10K ohm balanced.
- **Input level range:** +2 dBm to +24 dBm for peak level on tape.
- **Output impedance:** Less than 100 ohms in the band 30 Hz to 15 kHz.
- **Output level:** +24 dBm maximum into 600 ohms.
- **Power requirements:** 220-250 V.A.C. 50 Hz.

Slow Pulse Models turn on and off at .5 to 2Hz depending upon voltage at 50% duty cycle.
Warble Models are to be used with SC628D, SC628E, SC628H to produce two tones alternately.
Note A — Short Pulse Models turn on and off at .5 to 1.5Hz depending upon voltage at 10% duty cycle, substitute K in place of P or J in part number. Example: SC110K
Note B — For 6-28V AC/DC operation substitute 628A for 110 in part number. Example: SC628AHP
Note C — For 10-48 AC/DC operation substitute 648A for 110 in part number. Example: SC648AHP
Note D — For 60-250V AC/DC operation substitute 250 for 110 in part number. Example: SC250HP

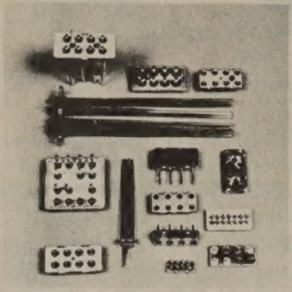
AIRPAX™ Hermetic Seals Glass / Ceramic-to-Metal Seals

■ Combining the most competent, experienced seals engineers with unsurpassed manufacturing facilities, production methods, and in-house plating capability . . . Airpax provides glass/ceramic seals of the highest quality and reliability. The engineering staff maintains close supervision of each order, always with an eye toward conscientious adherence to delivery schedules. The Airpax quality control program meets and exceeds MIL-Q-9858. Government source inspection is offered for military requirements.

For further information on Airpax Glass/Ceramic-to-Metal Seals capability, request Short Form Catalog 4002 and Bulletin 4001, a complete facilities report.

Relay Headers

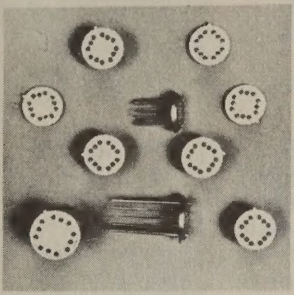


Airpax manufactures compression-type hermetic seals which will withstand extreme conditions of mechanical strain, vibration, thermal shock, and corrosive atmospheres. Bodies and terminals are of selected steels and alloys, and are fused with highly specialized glasses.

Single Pin Terminals

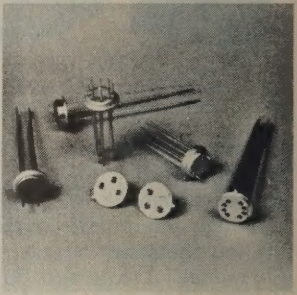
Available with flanged, straight wall (no flange), and threaded bodies. Can be supplied with any flange diameter, flange thickness, body diameter, or body length. Terminals are available in a variety of electrode diameters, lengths, materials, and configurations.

TO-8's



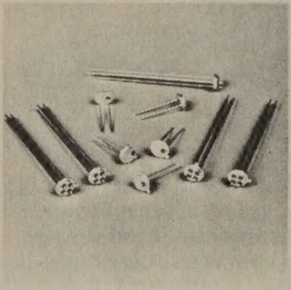
Available in 3-pin to 16-pin configurations, with optional brazed ground pins for special applications. To insure excellent die bonding and solderability, the TO-8 is supplied with Airpax's high purity Gold finish.

TO-5 Headers



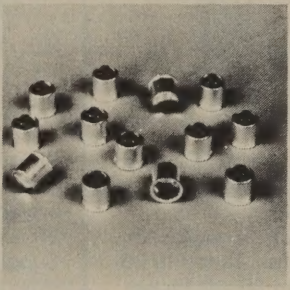
The complete line of Airpax TO-5 transistor bases covers a wide variety of pin lengths, pin quantity, and pin configurations. In addition to the standard TO-5, with all glass construction, Airpax makes an all-metal version with individual insulated leads, brazed or welded ground pins.

TO-46 Headers



TO-46, or light emitting diode headers are available with various lead lengths, number of insulated leads, and with or without butt welded pins. To assure best die bonding, solderability, heat resistance, and weldability, Airpax's high purity Gold is standard finish.

Lens Caps

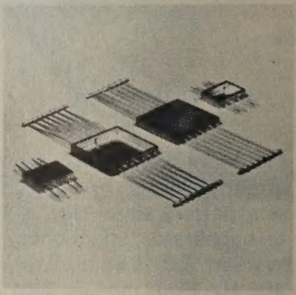


A number of standard design lens cap series are available for a variety of installation conditions. Special window diameters and other configurations of mounting rings, as well as special plating, may be utilized to meet your most stringent requirements.

Ceramic-to-Metal Seals

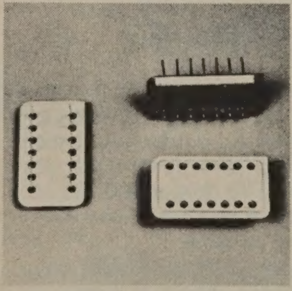
Airpax manufactures a complete line of ceramic-to-metal seals of all configurations. They are excellent electrical insulators, have high thermal dissipation, and operate at high temperatures. They maintain their hermeticity under adverse temperatures, shock, and vibration conditions.

Frame Packages



Airpax offers to the Hybrid micro-circuit manufacturer a significant improvement in flat packaging reliability . . . the all-metal package. Monolithic metal construction imparts high mechanical strength and greater heat dissipation to the Airpax flat pack.

Dual In-Lines

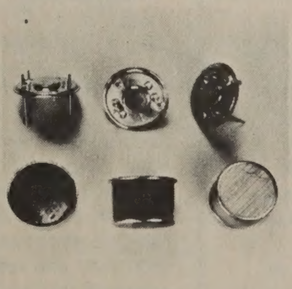


Airpax makes a variety of all-metal plug-in packages. All-metal construction results in extremely high mechanical strength, excellent heat dissipation, and provides maximum cubical content. Available in both Kovar and steel and, for non-magnetic applications, stainless steel.

Actuators

A complete line of Kovar actuators and pushers are available in the standard clear glass version, or can be fabricated in a variety of colors for indentification purposes. Airpax actuators can be produced with a number of compound bends for unlimited design flexibility.

Cold Weld Packages



Airpax manufacturers a complete line of solid copper weld packages. Cold welding prevents contamination that is prevalent in most other manufacturing techniques.

Custom Specials

Airpax engineers will work with your engineers, designing and developing the best hermetic seal for your application. Their intimate knowledge of electronics, metallurgy, glass sealing, ceramic metalizing and brazing can often simplify your problem and reduce your costs.

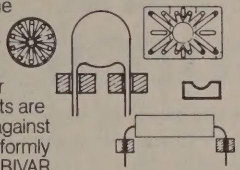
Can you find solutions to your design and cost problems from these standard Bivar Packaging Aids?

Yes. Because someone else probably had a similar problem before you did. In fact, during the past decade BIVAR has introduced *nearly 1,000 standard products,* most designed originally to solve costly Printed Circuit Board packaging or component mounting problems. These have resulted in lower assembly costs, fewer rejects and improved quality of product appearance and performance. Take for example, the advantages of accurately supporting transistors, capacitors and other devices. Components are protected, insulated against heat damage and uniformly positioned by using BIVAR **PERMANENT MOUNTS** and **SPACERS,** made of durable Nylon per MIL-M-20693A. Hundreds of standard styles for virtually any PCB component; low-cost and carried in stock by the thousands. For accurate, uniform component spacing above PCB surfaces, over 400 standard sizes of BIVAR **WASH-AWAY SPACERS** assure proper filleting and heat dissipation, and eliminate lead stresses and strains, washing away in warm or hot running water without a trace of residue. These extremely low-cost devices, designed for exacting application for almost any component, substantially reduce rejects and rework.



BIVAR can mean the difference in cost-savings and *real* PCB packaging design flexibility with the industry's most complete line of **SNAP-IN CARD GUIDES;** lengths from 2½″ through 14″, made of reinforced molded Nylon. Snap them into card cages or sheet metal at *your* spacing requirements. For 1/16″ PCBs, these low-cost guides feature rigidity, card insertion and assembly ease, and are stocked for immediate shipment.

For new, demanding designs, BIVAR Flame Retardant Card Guides offer the same range of sizes made of 94 V-O U.L. rated material; help the designer to meet flammability specifications. With INTERLOK, quality comes built-in. Finally, here are cabinets and enclosures that offer your electrical and electronic devices a custom appearance. After all, you are interested in displaying your product in the best possible way, and so is INTERLOK.

INTERLOK enclosures are designed for ease of assembly, versatility and rigidity. They are attractive as well as functional. Selecting the proper enclosures and accessories from the wide variety of standard stock items in the INTERLOK system becomes a pleasure, not an engineering chore.

Then, during assembly many unique design features become apparent. Interlocking aluminum extrusions and panels add a custom look to the enclosures. Outside beauty is enhanced by matching color strips that conceal all hardware after assembly. And, speaking of hardware, our workmanship boasts of drilled and tapped holes for machine screws. Sheet metal screws are not for us.

Inside, the enclosure can be subdivided in numerous ways to hold printed circuit boards or other components with access and loading from the front, rear, top and bottom.

INTERLOK not only offers total versatility and beauty in design, but offers all of our products from stock, and through your local electronics distributor. Availability is just one more service from INTERLOK.

The story doesn't stop here. We also have the newest and most exciting control knob available, the all new COLLET KNOB. No more set screws and no more marred front panels; just perfectly aligned control knobs. Interested? Then turn to the knob section in this catalog for the full story.

See if you don't agree that INTERLOK has the answer and the products to back you up no matter what your packaging requirements. Call now for your own "Seeing is Believing" demonstration. Our sales and applications personnel are delighted to show off our products.

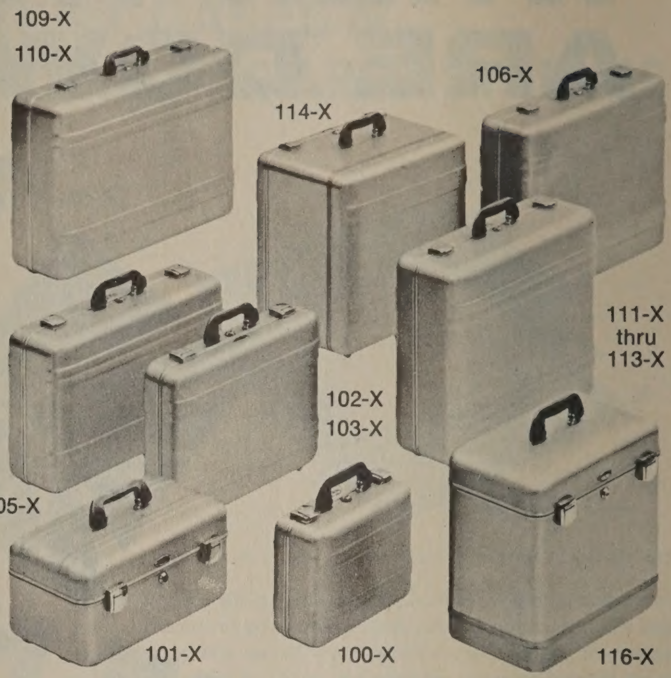
ZERO CENTURION® "ELITE" CARRYING CASES



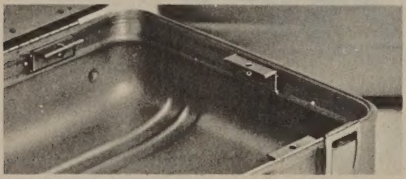
Top-of-the-line protection and appearance for your finest equipment

High strength, light weight, and clean simple lines characterize these distinctive deep drawn cases. Surfaces are seamless and wrinkle-free, while satin buffing and anodizing, standard finish for the line, make the most of aluminum's natural good looks.

Zero Centurion "Elite" cases are dustproof, weather resistant and odorproof; and their strength and durability have been proven in actual use around the world. Each is strong enough to stand on, thanks to specially heat treated case shells; yet even the largest (19.10" x 50.35" x 6.25") weighs only 17 pounds.

FEATURES

Zero continually improves the appearance, reliability and versatility of this line. Positive-locking latches assure secure closing while complimenting the clean styling of each case.



A fully gasketed tongue-and-groove closure extrusion, bonded to case shells, offers not only better sealing and case integrity, but also permits the installation of adjustable panel support brackets (optional) at significant savings over other methods of attaching angles for panel mounted equipment. Blank panels are available on special order.

DELIVERY

Normal delivery for standard cases and panel mounting brackets is two weeks after receipt of your order and will be filled from the Zero facility nearest your location. Allow 4 week delivery for cases with foam packs.

100X SERIES

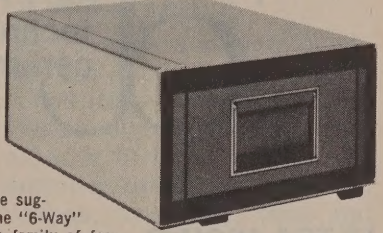
the vip 6-way line



The VIP 6-Way Line, as its name suggests, is more versatile still. The "6-Way" nomenclature derives from this family of features: (1) Vertical Nesting via positive-nesting feet, for temporary groupings; (2) Vertical Interlocking via dove-tail stack-joiner strips and integral grooves, equivalent to rack mounting in less space and without the rack and its limitations; (3) Horizontal Interlocking via dove-tail strips and grooves, for side-by-side mounting of multiple instruments; (4) Rack Mounted via accessory brackets, plus optional chassis or rotation slides, for insertion into the VIP Series 19 units or other EIA Std. racks; (5) Briefcase Portable via cast fold-away handles or self-retracting strap handle plus optional front/rear dust covers; and (6) Tiltable via an accessory tilt stand, for bench and desk-top use without parallax. It is this extraordinary versatility and the strength of castings, extrusions and heavy-gage aluminum that makes the VIP enclosures worthy of your designs. The VIP 6-Way Line has the unique feature of removable top and bottom panels.

VIP 6-Way standard modules come unassembled in both 17″ and 8.50″ outside widths, and are designed for interlocking without gaining width.

Performance Curves

ULTRA HIGH Q

is characteristic of the ATC 100 capacitors through microwave frequencies, even at high ambient temperatures, and under extremely high currents, permitting reliable operation at high power levels. Output power increases of greater than 20% per stage are reported when ATC 100's, with their negligible I^2R losses, are substituted for conventional capacitors. The reduction of losses also produces greater DC-to-RF conversion efficiency, improvements of 35% being reported. Improvements in Noise Figure are also attainable in receiver applications.

HIGH-POWER

operation through microwave frequencies. Extremely low Equivalent Series Resistance (ESR) and high dielectric strength permit 15 KW pulse operation (900 watts average) at 500 MHz (3000 volts, 17 amps RF) in a 50 ohm system. Other typical applications are 500 watts (CW) at 1 GHz and 1 KW (avg.) at 50 ohms up to 3 GHz.

LOW NOISE FIGURE

in receiving systems is achieved by the very low equivalent series resistance and extremely high Insulation Resistance (I.R.) of the ATC 100's. In an RF preamplifier, their low ESR helped attain a N.F. of 1.4 dB with a 1.2 dB transistor N.F. at 500 MHz. The high Insulation Resistance (ultra-low leakage) of an ATC 100 used as a calibration capacitor at the input of a charge storage amplifier on an X-Ray Spectrometer made possible a threshold sensitivity of 150 eV.

HIGH SELF-RESONANCE

is shown by test data taken on a Hewlett Packard 8542A Network Analyzer covering S-Parameters, VSWR, Reactance, and Insertion Loss over the frequency range of 100 to 3000 MHz. Request **THE RF CAPACITOR HANDBOOK** for actual S-Parameter computer print-outs.

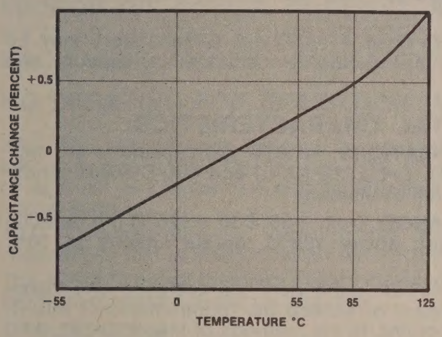
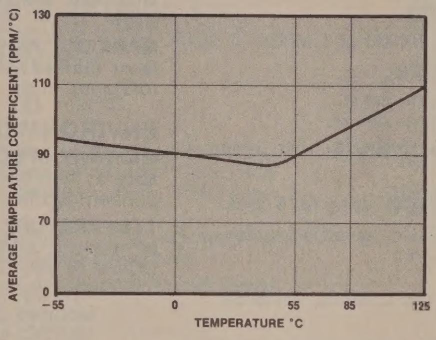
ATC 100 UHF/MICROWAVE CAPACITORS

Stability





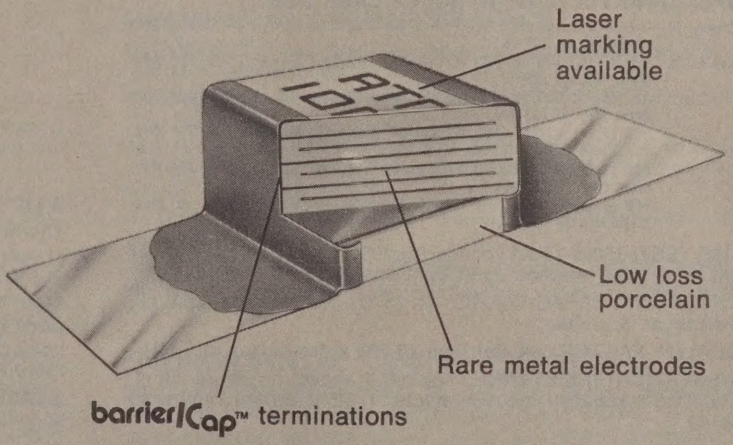
ULTRA-STABLE

performance is assured by the self-encapsulating porcelain construction. ATC 100's provide absolute retrace, no measurable drift, and complete stability under extremes of voltage, frequency, time and temperature. They are ideal for high-power, high-current, tuning, or impedance-matching applications.

Structure

SELF-ENCAPSULATING PORCELAIN CONSTRUCTION

Rare metal internal electrodes are molecularly bonded and sealed in a monolith of non-porous porcelain. The ATC 100 is a hermetic, microminiature, self-encapsulated, high voltage, porcelain chip capacitor matched to the thermal coefficient of expansion of commonly used substrate materials.



RUGGED TERMINATIONS

The ATC **barrier/Cap™** termination is now standard on all pellets and leaded capacitors. The terminations remain intact under the most severe thermal shock, and are not dissolved away even by the most careless soldering. They easily withstand a 5 minute submersion in 375°F solder pot without leaching, while retaining complete solderability. Migration is virtually eliminated and a bond strength greater than 30 lbs. is typical for "B" Case capacitors (110 mils square) with nail head leads.

HERMETIC

The severe thermal shock to which capacitors are subjected by direct soldering during circuit assembly can destroy the integrity of conventional capacitors, permitting flux and solvents to penetrate the dielectric. ATC porcelain capacitors are hermetic and are not degraded by the assembly process.

A simple and easy hermeticity test to simulate the thermal shock of soldering and subsequent absorption of contaminants is to drop the capacitor into boiling salt water. Remove, wash and verify hermeticity by retesting I.R., capacity, and Q. (For details, see ATC SW 100 Boiling Salt Water Test on page 1164.)

RELIABILITY

Reliability after circuit assembly is outstanding due to the rugged and hermetic structure provided by the self-encapsulated porcelain construction. ATC's design of the chip capacitor internal structure and dielectric has resulted in the most reliable porcelain capacitors available proven by extensive testing programs of approximately 2 million component hours per month.

ATC has complete Government approved Hi-Rel testing facilities as well as RF production testing capability through 2.5 GHz.

LASER MARKING

Is available on ATC capacitors for quick and complete identification of capacitor source, value and tolerance. This highly legible and permanent marking results in no degradation of performance or reliability and is impervious to all cleaning solvents.

*VNMS improves the resonant frequency performance over that of the standard Microstrip. The first important resonance is approximately twice as high in frequency as with "flat" mounting (NMS). Note that in this configuration, the marking is now on a vertical surface. For details, contact factory.

Silver leads are attached with high temperature solder.

LASER MARKED CAPACITORS with manufacturer's identification, capacity and tolerance code are available for any case size (including chips and pellets). To order, add suffix (X) to code.

Other solders may be applied to pellets on special order. Contact factory with specific requirements.

CHIP CAPACITORS

Micro-miniature devices designed for use in thick film, thin film, and other hybrid applications, each with a selection of terminations available to solve the most complex bonding problems. Ideal where small size, high stability, excellent performance, and reliability are required, as well as negligible lead inductance and extremely high Q at high frequencies.

GLASS SEALED DEVICES

Glass sealed capacitors available where reliability requirements increase, but keeping production costs at reasonable levels. To meet your production needs Centre Engineering offers you our newest member of our growing line of capacitors, the glass sealed multi-layer capacitors in strip form. Small in size and hermetically sealed, these capacitors are rugged, reliable, and ideal for automatic insertion.

CRC HIGH RELIABILITY CAPACITORS	ADVANCE NEW PRODUCT INFORMATION
NEW PRODUCTS	**IMPORTANT! PREVIEW OF NEW PRODUCTS TO APPEAR IN NEXT YEAR'S 1978-1979 eem CATALOG** Since CRC believes these unique new capacitors will effect significant design changes as well as advances in the state of system performance, CRC is preparing complete specification sheets for immediate distribution. Please write or phone for details.
MINIATURE METALLIZED POLYCARBONATE	Type G12 minature, hermetically sealed, metallized polycarbonate capacitors will replace most non-hermetic (usually non-reliable) "wrap and fill" and molded plastic film capacitors due to their reduced physical size. Type G12 capacitors have the same rugged high quality construction as CRC MIL-C-83421/01 qualified metallized polycarbonate types featured in this catalog. Due to their small size, G12 capacitors can now replace unreliable non-hermetic (or hermetic) poor quality capacitors. G12 capacitors are rated from 30 VDC to 100 VDC and 22 VRMS to 60 VRMS, 400 Hz for continuous duty. For G12 capacitors, values up to 0.075 μF, 30 VDC, are 0.185" max. diameter with sleeving by 0.530" max. Case length, with a max. bead to bead length of 0.600". For G12 capacitors which have one lead connected to the case, the lengths are 0.062" shorter.
200 VRMS TO 800 VRMS 400 Hz AC METALLIZED POLYSULFONE	Type QA14 AC-DC rated hermetically sealed, tubular, metallized polysulfone capacitors will soon be featured as a MIL Spec qualified established reliability capacitor for motor run, resonating, and general purpose filtering applications. The unusually rugged low loss CRC electrode terminations provide coolest performance with continuous duty AC operation. All capacitors are corona free at rated RMS voltage conditions and are designed for many years of operation under rugged military or space environmental conditions. Please write for complete QA14 specifications.
160 KHz AC LOW LOSS FOIL POLYPROPYLENE	A space age requirement for small low loss capacitors to handle 400 VRMS at 160 KHz led to the development of Type R55 foil polypropylene capacitors. Capacitors capable of rating up to 5 KVA per cubic inch are now possible due to the low loss and efficient design of CRC AC engineered foil polypropylene capacitors. Write for complete specifications on Type R55 capacitors.
±8 PPM/°C LOW TC METALLIZED POLYSULFONE	Type QA14 specially selected high reliability metallized polysulfone capacitors are virtually zero TC from 0°C to 75°C and feature excellent low loss, high stability characteristics which surpass the best NPO ceramics or other low TC capacitors. Write for complete specifications on QA14 capacitors. Please reference **eem** J Catalog.
DUAL LAYER HIGHER RELIABILITY METALLIZED CAPACITORS	Metallized capacitors operated in a high impedance circuit, where the voltage slowly ramps up from zero and the current is limited, may experience intermittent low insulation resistance when operating under temperature cycling conditions. CRC has developed screening techniques to minimize such possible problems, which may occur with their standard single layer film capacitors, designed for high IR requirements. As further insurance against any problems in worst case ramp voltage temperature cycling operation, Type QA12 dual layer 50 VDC and higher rated metallized polycarbonate capacitors are now available. Send for QA12 specifications.
HIGH ENERGY, HIGH TEMP. FOIL POLYSULFONE	Type R54 foil polysulfone capacitors are designed for high peak current, high repetition rate, AC switching, pulsing, and general filtering applications. Write for complete R54 specifications.
HIGH DENSITY MINIATURE NON-POLAR KEL-FILM	CRC has developed Type QA16 metallized Kelfilm capacitors of subminiature size as a result of development programs for NASA and the air force. 200 volt and higher rated foil tantalum capacitors can now be replaced with a non-polar, non-electrolyte capacitor made from a high dielectric constant film. Typically a 20 μF, 200 VDC capacitor fits a 0.750" diameter x 2.375" tubular metal case. The QA16 capacitors are being used for output filtering in the F-18 and other aircraft programs. Please write for complete QA16 specifications.
±0.05% TRIMMED POLYSTYRENE	Type QA53 polystyrene capacitors can be supplied trimmed to ±0.05% for use as laboratory standards, test equipment internal standards, analog applications, or wherever high accuracy stability, high insulation resistance, and low dielectric absorption capacitors are required at moderate cost. Write for complete QA53 specifications.

SUPPLEMENTARY CAPACITOR-INFORMATION SECTION

CATALOG SUPPLEMENT

CRC has added this section to provide information on new products, unusual capacitor test data, and a compilation of miscellaneous items of interest to designers, component engineers, and reliability personnel. In addition we are planning to manufacture a comprehensive product line of standard and custom feed-through capacitors and EMI filters. We believe these products will be of higher quality and performance than any similar products now available.

Many of our customers now using EMI filters have expressed dissatisfaction with the quality and reliability of the filters presently available, and have urged us to enter this area of interest. Please forward to us any of your requirements for capacitors, networks, and EMI filters, so that we can determine if we can meet your needs.

Facts about MIL-C-83421

This catalog covers comprehensive information concerning MIL-C-83421/1 capacitors, including dimensions, specifications, quality assurance, retention of qualification testing and pricing.

Component Research Co. presents this information as part of its effort to improve the reliability and performance of capacitors for aerospace use.

MIL-C-83421 is a new general specification that contains higher quality, reliability and performance, metallized plastic film capacitors than MIL-C-39022/1 to MIL-C-39022/8. MIL-C-83421 will ultimately cover a range of metallized polycarbonate, polysulfone, polystyrene, polypropylene, teflon, and other plastic films. The scope of MIL-C-83421 will be to provide 100% screened, high reliability capacitors suitable for critical aerospace and industrial use.

Special screening tests and tight parameter limits have been incorporated in order to make MIL-C-83421 capacitors superior in reliability, performance, and quality for DC or AC applications.

Additional testing and data covering corona, radiation effects, ESR ratings, and dielectric absorption ratings with temperature and short durations, will ultimately be included.

HIGH INSULATION RESISTANCE

Styles CRH01 to CRH05 exceed 3,000,000 megohms at 25°C for values 0.1 uF or less. CRC polycarbonate capacitors have the highest insulation resistance of any capacitors available for their size. Specially screened capacitors of this type are available with an insulation resistance of 1,000,000 megohms-uF at 25°C and improved IR characteristics at higher temperatures.

AC RATED TO 40 KHz

CRC miniature metallized polycarbonate capacitors have a dissipation factor so low, (generally 0.1% but rated 0.15% max.) that they can handle high current for their size. Their dissipation factor remains low after burn-in, 100% thermal aging, and AC square wave hipot. This quality feature of CRC capacitors makes them mandatory for use in most aerospace programs which require maximum reliability in AC applications under extreme environments.

HIGH STABILITY LOW TEMP. COEFFICIENT

The A12 and K12 capacitors offer a choice of temperature coefficient and stability limits to suit your application requirements. The capacitance vs. temperature slopes from capacitor to capacitor within a lot are very similar. The A12 series differ approximately ±30PPM/°C from unit to unit, within a lot, from −55°C to +125°C.

LOWEST COST HIGHEST RELIABILITY

When ordinary type metallized polycarbonate capacitors are subjected to a form of screening to hopefully produce high reliability capacitors, the results may be costly and uncertain. The savings achieved by the use of CRC capacitors are: **Uniform performance, longer equipment life possible; Improved stability, reduced rejects, and costly failure analysis. The cost for continuous Group B testing for retention of qualification is included in the unit price; there are no extra costs for test samples or testing.**

AC-DC LIFE TEST DATA

MIL-C-83421/1 POLYCARBONATE CAPACITORS

DC LIFE TEST

Data shown is typical of continuous DC life testing performed monthly with samples from current production lots. Samples are tested monthly to maintain failure rate R (0.01%/1,000 hrs.).

AC LIFE TEST

Each month capacitors of assorted values selected from Table I of MIL-C-83421/1 and of the voltage rating specified in paragraph 4.6.2.1.1 (b) of MIL-C-83421, are submitted to 250 hours life at the test voltage and frequency specified in Table V of MIL-C-83421/1.

The excellent low loss and high quality of CRC polycarbonate capacitors enables them to withstand this severe testing without failure. Under these test conditions a 3.9 uF, 50 VDC capacitor is handling 5 AMPS RMS. This can be considered outstanding with a case size as small as 0.562 x 1.375. A 3.9 uF, 50 VDC capacitor is normally rated at 3.6 AMPS RMS AC MAX, as shown in Table I of MIL-C-83421/1.

CRC HIGH RELIABILITY CAPACITORS

HOW TO SELECT AND SPECIFY MIL-C-83421/1 CAPACITOR PART NUMBERS

SELECTION INFORMATION

MIL-C-83421/1 covers 30 volt to 400 volt DC rated capacitors for applications requiring a tight capacitance tolerance, excellent capacitance stability, very high insulation resistance and low loss factors. This specification applies in addition where the AC component of voltage is large with respect to the applied DC voltage, and where momentary breakdowns cannot be tolerated.

MIL-C-83421/1 offers the users two quality level styles. Each style includes 30 VDC, 50 VDC, 100 VDC, 200 VDC and 400 VDC rated capacitors, with 0.25%, 0.5%, 1%, 2%, 5% and 10% capacitance tolerances to select from.

A study of catalog page 3 provides a comparison of screening steps and key features that are unique with capacitors qualified to MIL-C-83421/1. If any doubt exists as to the use of these capacitors for high energy AC conditions not covered in the AC ratings of Table 1, a complete description of current and voltage conditions, including waveforms, should be forwarded to us for review and recommendations.

CONSTRUCTION INFORMATION

All CRH capacitors are tubular, metal cased, with both wire lead terminals isolated from the case. All the capacitors are provided with a plastic heat shrink-fit sleeve to insulate the metal case. The lead wires are #22 AWG for 0.312 or less case diameters and #20 AWG for 0.400 and 0.500 diameters. The lead wires are normally tinned copper clad steel per type "W" of MIL-STD-1276. Capacitors with gold plated nickel leads per N2 of MIL-STD-1276 can also be provided at additional cost. For 0.562" and larger diameters, #18 AWG tinned copper, OFHC, leads are used.

Unless you specifically request a lead material type for 0.500" and smaller diameters, Component Research will supply the material currently in production at time of order.

AC RATINGS

AC ratings at 400 Hz; 4000 Hz; and 40,000 Hz RMS AC voltage (sinusoidal), with current limits from −55°C to +100°C, are listed for each individual capacitance value and DC voltage rated style in Table 1. When operating above 100°C, derate all voltages linearly from full rated voltage at 100°C to 50% of rating at 125°C.

Although CRC capacitors have a low dissipation factor of 0.15% max. at 25°C, their dissipation factor is lower yet at temperatures from 75°C to 125°C.

This results in lower watts-loss and heat rise at elevated temperatures — with, of course, improved reliability for AC or DC applications.

APPLICATION NOTES

Make certain that the sum of any instantaneous peak AC voltages plus any superimposed DC voltages do not exceed the capacitor's rated DC voltage.

Effective heat sinking will permit operation at higher current levels than listed in Table 1. However, our CRC application engineers should be advised prior to use in any application where non-sinusoidal operating conditions are encountered, or when higher RMS currents are involved.

Component Research Co. can supply special AC capacitors with greater current handling capability and reduced heat rise.

FAILURE RATE LETTERS

Component Research is presently qualified to failure rate "R" and intends to maintain this level continuously. Because MIL-C-83421/1 has such stringent post test limits, an "R" failure rate is indicative of higher quality than a higher letter such as "S" in other film capacitor specifications with looser post test limits.

CRC HIGH RELIABILITY CAPACITORS

MIL-C-83421/1 AC RATED CAPACITORS RELIABILITY QUESTIONS AND ANSWERS

What are the limiting factors restricting the use of metallized polycarbonate capacitors for AC applications?

A properly manufactured and screened capacitor can handle considerable RMS and peak currents from −55°C to +125°C without significant case temperature heat rise. The dissipation factor of capacitors to be used in AC applications must be uniformly low to limit the watts loss incurred usually by capacitors with a high (ESR) equivalent series resistance.

We recommend a maximum dissipation factor of 0.15% at 1 KHz as the acceptance test limit. All capacitors should be subjected to temperature cycling prior to final measurement of DF to observe if they remain less than 0.15%. This test eliminates problems which may occur in use, after storage, or operation at extreme temperatures, leading to higher DF and operational failure.

CRC catalog page 9 contains the maximum RMS current and voltage ratings for sinusoidal conditions, continuous duty cycle, at 400 Hz and 40 KHz. For conditions other than shown, send to our sales office a sketch of the current and voltage waveforms under worst case and normal operating conditions. Include all other information necessary for quotation purposes.

Is polycarbonate better than other dielectrics for AC applications?

If size, weight, cost, or operating temperatures were not important considerations, then other dielectric style capacitors are superior to polycarbonate.

As an example, CRC can supply polystyrene, teflon, or polypropylene AC capacitors with approximately ten times lower loss than the series 12 polycarbonate capacitors.

Polysulfone introduced as a new product on pages 38 and 39, is slightly better than polycarbonate for AC applications below 100°C, and can be used above 125°C (the limit for polycarbonate), to 150°C with proper voltage derating.

CRC considers mylar and paper dielectric styles too lossy for AC applications and therefore does not recommend this type for such requirements. Additional information on AC capacitors appears on other pages of this catalog.

What type of screening test will assure that the polycarbonate capacitors are reliable for AC applications?

Once it has been determined that your application requirements can be met by CRC standard polycarbonate series 12 capacitors, the screening test used by CRC and incorporated into MIL-C-83421/1 will be sufficient to provide the quality assurance needed.

As an example 100% of the capacitors are temperature cycled then are subjected to a square wave voltage at 100 Hz at 300% of rated DC voltage for peak to peak amplitude.

During this test the capacitors must handle approximately 35 microsecond wide current pulses for one minute at a rate of 200 per second.

A routine examination of the current and voltage waveforms during square wave hipot of 10 uF, 50 VDC type CRH capacitors, shows that with 150 volts peak to peak voltage at 100 Hz applied, the peak current is 85 amps. This is equivalent to operation with a half sine wave peak current pulse of 8.5 amps/uF at a 200 PPS rate. SEE WAVEFORMS AT RIGHT.

Following the square wave voltage stress test the capacitors must meet 0.15% max. dissipation factor limits.

As shown on catalog page 5, life testing of CRC metallized polycarbonate capacitors at 400 Hz and 4000 Hz is performed continuously as retention of qualification to MIL-C-83421/1.

Are the new CRC series 12 AC rated polycarbonate capacitors higher in cost than their earlier type PL and PG capacitors supplied since 1965?

A study of series 12 polycarbonate prices, shows that with few exceptions price reductions (particularly for closer tolerances and larger uF values) are the rule. An examination of the series 12 specifications shows higher guaranteed performance and continuous retention of qualification testing. This in itself represents a substantial price decrease in terms of value adding without increased cost.

Why are CRC low dissipation factor polycarbonate capacitors replacing commonly manufactured capacitors in AC applications?

There is a risk that the dissipation factor of such capacitors will increase with use and result in hot spots at the terminations. Field failures of such capacitors have been reported where the capacitors have exploded and caused fire damage.

It may be possible to use ordinary higher DF capacitors without noticeable problems at 400 Hz provided that RMS voltage is sufficiently low such that the RMS current is limited. Heat sinking will also help prevent excess heat rise due to poor quality terminations.

Interestingly enough CRC polycarbonate capacitors have a lower dissipation factor at temperatures from 75°C to 125°C than at 25°C which lowers their effective heat rise at higher temperatures. Where the current source is limited, higher DF capacitors may not heat sufficiently to short, but may gradually suffer from increasing DF to the point where they are effectively open.

What is the maximum current that can be applied to MIL-C-83421/1 capacitors?

The 40 KHz current and voltage ratings listed in Table I of the Mil-Spec and also shown on page 9 of this catalog are based upon continuous operation under sinusoidal conditions. It is essential that any use under conditions exceeding these limits be discussed further with our applications engineers for elimination of failures. Under certain conditions, the capacitors can be used at higher frequencies and in square wave filtering applications. For good reliability it is best to study these special applications on an individual basis. CRC plans to provide data tables showing allowable working conditions during higher frequency sinusoidal, pulsed, and non-sinusoidal conditions.

SERIES 12 POLYCARBONATE

AC RATINGS 400 Hz TO 40,000 Hz COVERS MIL-C-83421/1 AND MIL-C-39022/9C CAPACITORS

Component Research Co. has over 150 KVA of specialized AC generating equipment operating from 400 Hz to 100,000 Hz, sinusoidal conditions, for burn-in, life testing, and continuous research and development. In addition, square wave and pulse generators capable of simulating massive energy stress or sharp rise times enables Component Research engineers to sample test standard production type capacitors to ascertain their capability under higher stress operating conditions. Custom designed capacitors for critical space, military, and commercial applications are thoroughly screened and evaluated to eliminate excess heating or any other cause for failure. The AC ratings of MIL-C-83421/1 were developed as a result of tests conducted on CRC polycarbonate capacitors from 400 Hz to 40,000 Hz. Following is data similar to that found in MIL-C-83421/1.

AC Ratings: AC ratings are for sinusoidal conditions from −55°C to +100°C. Derate linearly to 50% of AC rated RMS voltage at 125°C.

* MIL-C-83421/1 HAS REPLACED MIL-C-39022/9C FOR NEW DESIGN. CRC WILL CONTINUE TO SUPPLY BOTH TYPES AS REQUIRED. SEE PAGES 2-11.

HIGH INSULATION RESISTANCE

CHROIA, D, G, K and N styles exceed 3,000,000 megohms at 25°C for values 0.1 uF or less. CRC polycarbonate capacitors have the highest insulation resistance of any capacitors available for their size. Special CRC capacitors are available with higher limits.

AC RATED TO 40KHz

CRC miniature polycarbonate capacitors, have a dissipation factor so low, (generally 0.1% but rated 0.15% max.) that they can handle extremely high RMS or peak current. See page 9 for further information.

HIGH STABILITY - LOW TEMPERATURE COEFFICIENT

Three quality levels are available with a choice of drift and TC limits suitable for most temperature sensitive applications. Long term drift data on file indicates 0.5% max. capacitance shelf drift for five years, with current production showing improved stability.

FREE FROM MOMENTARY BREAKDOWNS

CRC capacitors are engineered to be completely free from breakdowns, intermittents or noise. All CRC capacitors must pass rigorous testing with sensitive equipment capable of detecting changes of several picoamps.

HIGHEST QUALITY AT LOWEST COST

Year after year CRC capacitor quality is upgraded. CRC specifications become more exacting, yet CRC manages to maintain or lower capacitor prices. Furthermore, there are no additional charges for MIL-C-39022/9 Retention of Qualification Testing, when purchasing CHROI capacitors from CRC (See page 4 for Retention of Qualification Testing.)

CRC HIGH RELIABILITY CAPACITORS

HOW TO SELECT & SPECIFY

*MIL-C-39022/9 CAPACITOR PART NUMBERS

* MIL-C-83421/1 HAS REPLACED MIL-C-39022/9C FOR NEW DESIGN. CRC WILL CONTINUE TO SUPPLY BOTH TYPES AS REQUIRED. SEE PAGES 2-11.

SELECTION INFORMATION

MIL-C-39022/9 covers 30 volt to 400 volt DC rated capacitors for applications requiring a tight capacitance tolerance, excellent capacitance stability, very high insulation resistance and low loss factors. This specification applies in addition where the AC component of voltage is large with respect to the applied DC voltage, and where momentary breakdowns cannot be tolerated.

Table II of MIL-C-39022/9 describes in part, three quality levels and their respective performance and test criteria.

CRC has clarified the data shown in table II and all additional specifications requirements, by presenting this information in test plan form on page 12 of CRC catalog J.

A study of life test data on Page 5 will indicate the excellent characteristics of polycarbonate capacitors manufactured by Component Research Co. to MIL-C-39022/9 latest revision.

HOW TO SPECIFY MILITARY PART NUMBERS

Select the style required, then place the dash number after M39022/9. As an example: A 0.001 uF 1% 50VDC CHROIE capacitor as shown in table 1 would be identified as M39022/9-E003R. **R indicates our failure rate as of 1976. See section dealing with failure rates on this page.**

SLEEVING

All CHROI capacitors are mylar shrink-fit sleeved.

LEADS

All CHROI capacitors are supplied with #22 AWG tinned copper clad steel leads for 0.312″ or less case diameters. #20 AWG leads are supplied for 0.400″ and .500″ diameter capacitors. Gold plated nickel leads are still being used where specifically requested, but are not recommended for new designs. #18 AWG tinned copper, OFHC leads are used for 0.562″ and larger diameter capacitors.

Unless you specifically request a lead material choice for the 0.500″ diameter and smaller cases, Component Research will supply the material currently in production at time of order.

AC RATINGS

AC ratings at 400Hz; 4000Hz; and 40,000Hz RMS AC voltage (sinusoidal), with current limits from −55°C to +100°C, are listed for each individual capacitance value and DC voltage rated style in table 1. When operating above 100°C, derate all voltages linearly from full rated voltage at 100°C to 50% of rating at 125°C.

CRC qualified polycarbonate capacitors, with a 0.15% max. dissipation factor, will in a still-air environment, and at maximum rated operating conditions rise no more than 20°C. With conventional heat sinking methods, the capacitor heat rise will be considerably less than 20°C.

Although CRC capacitors have a low dissipation factor of 0.15% max. at 25°C, their dissipation factor is lower yet at temperatures from 75°C to 125°C.

This results in lower watts-loss and heat rise at elevated temperatures — with, of course, improved reliability for AC or DC applications.

APPLICATION NOTES

Make certain that the sum of any instantaneous peak AC voltages plus any superimposed DC voltages do not exceed the capacitor's rated DC voltage.

Effective heat sinking will permit operation at higher current levels than listed in table 1. However our CRC application engineers should be advised prior to use in any application where non-sinusoidal operating conditions are encountered, or when higher RMS currents are involved.

Our engineers will be pleased to study your needs and advise you if the capacitors will operate reliably under your special operating conditions.

Component Research Co. can supply special AC capacitors with greater current handling capability and reduced heat rise, in the same case sizes as shown for MIL-C-39022/9. **See page 35.**

FAILURE RATE LEVELS

Component Research Co. is conducting continuous lot testing in order to achieve lower failure rates. Upon periodic review of this data by DESC, lower failure rates will be granted based on total number of capacitor life test hours without any failure.

Because MIL-C-39022/9 has such stringent post test limits the failure rate levels in MIL-C-39022/9 are effectively lower than the same failure rate levels in conventional film capacitor specifications and other military specifications.

MIL-C-39022/9C VS MIL-C-83421/1

MIL-C-39022/9C Polycarbonate capacitor specifications have been replaced by MIL-C-83421/1 as explained in CRC catalog pages 2-11. MIL-C-83421/1 screening steps are not basically different than those of MIL-C-39022/9C but re-writing of the documents has resulted in a more clearly understood specification for our Metallized Polycarbonate capacitors. Several case dimensions were changed in going to MIL-C-83421/1, and minor corrections were made in current and voltage ratings, and several capacitance values were added and deleted. CRC will continue to supply both types as long as required by our customers. All "C" max dimensions for Series A12 and K12 capacitors shown on page 8 of catalog J, are 0.1" shorter than for MIL-C-39022/9C capacitors listed below.

All capacitor values and dimensions which differ from MIL-C-83421/1 or from CRC A12, K12 specifications are shown in bold face type below.

CRC HIGH RELIABILITY CAPACITORS

CAPACITOR IDENTIFICATION & CROSS REFERENCE TABLE

Component Research Co. has been manufacturing precision film capacitors since 1959. As a result of introducing new, improved products, our part numbers have changed and a few older types are now considered obsolete. CRC will continue to supply obsolete types if you cannot find a substitute item, and we are able to obtain the required film materials. Following is a guide to the old and new part number types which are similar. Due to possible differences in screening, dimensions, and performance, it is best to contact our applications department when you plan to retrofit or use our new part numbers to replace the old. Old catalogs describing obsolete part numbers are available if required.

IDENTIFICATION FOR SPECIAL REQUIREMENTS

CRC believes that there is a sufficient choice of capacitors in this catalog to satisfy virtually all applications. In the event you have any requirement involving a modification of our specifications the following special identification will be used.

Example: X11B154BW588 (typical special part number). "X" preceding the part number indicates a special customer requirement. The number group at the end of the part number is assigned as a unique identification of the special manufacturing and inspection instructions.

In the example shown above "588" is a typical unique identification number.

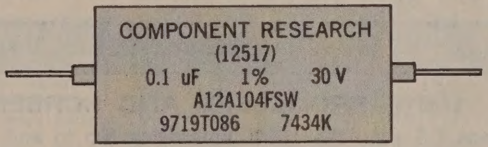
PART NUMBER EXAMPLES

Example 1 A12A104FSW shown to the right and in the marking example on Page 18, is a metallized polycarbonate, 0.1 uF, 1%, 30 VDC, ungrounded case, capacitor. The capacitor has sleeving, tinned copper-clad steel leads, 48 hours burn-in, and 10 thermal aging cycles. It is made to quality level 1.

Example 2 C11B183FXW is a "C" screened metallized teflon level 1 capacitor, 0.018 uF, 1% tol., 50 VDC. No sleeving is required. It has an ungrounded case and tinned copper clad steel leads.

Example 3 E22D15993BSC is "E" screened, metallized polycarbonate, 1.599 uF, 0.25%, 200 VDC. The capacitor has a grounded case with mylar sleeving and OFHC leads. 15993 in the part number is derived by adding three zeros to 1599 to make 1,599,000 picofarads, which is 1.599 uF. Example 3 is considered a nonstandard part because of the grounded case and the uF value.

MARKING EXAMPLE — Standard Types



UNIQUE TEST & SERIAL NO. — All level 1 capacitors are permanently identified with a test number followed by a serial number for traceability to test records. 9719T is a typical test number, 086 is the capacitor serial number.

LOT CONTROL NO. — All level 1, 2, and 3 capacitors are traceable to process records and materials used, by means of the weekly date code. The individual lot letter K, indicates the tenth lot made in the 34th week of 1972.

NOTE: ONLY LEVEL 1 CAPACITORS ARE SERIALIZED

MANUFACTURING & INSPECTION FLOW PLAN

MIL-C-83421 • MIL-C-39022/9C • STANDARD CAPACITORS

100% INSPECTION PER MIL-C-83421

The high reliability capacitor screening plans developed by Component Research Co. have been adopted by space and military contractors throughout the world for critical programs. The new general specification MIL-C-83421 incorporates much of the screening features shown below at an attempt to provide a "state of the art" capacitor specification for general industrial and aerospace use.

Our flow plan for manufacturing and inspection shown below covers the steps used to process and screen all of our polycarbonate, teflon, polystyrene and polysulfone film capacitors. The individual specifications shown in the catalog list the actual screening performed for each style. A choice of three quality levels provides different degrees of intensive screening to assure the highest possible quality at lowest cost. Special screening plans are available which include tests such as 100% corona inception inspection, 40 KHz AC burn-in at 100°C, high impedance monitoring for intermittent conditions at low voltage during temperature cycling, ESR inspection at 100 KHz, dielectric absorption effects with rapid switching rates and varying temperature, and many other sensitive measurement phenomena.

CRC HIGH RELIABILITY CAPACITORS

GENERAL PRODUCT INFORMATION

ORDERING INFORMATION — Terms: Our terms are net 30 days to customers approved by our credit department. All shipments are F.O.B., Santa Monica, Calif. **Delivery:** Most items listed are available from stock or within 10 weeks for quantities up to 1000 pieces. **Minimum Order:** Minimum billing per order is $30.00. **Complete Part Number:** Please make certain that you have complete part number to avoid any errors or delays. Please check part number instructions in individual specification pages and part number information shown on page 18.

PATENT INFORMATION — CRC capacitors are exclusively manufactured under one or more of the following patents and additional patents pending: 3,238,428; 3,260,906; 3,292,063; 3,506,895; 3,539,886; 3,603,849; 3,626,362.

CONSTRUCTION INFORMATION — All standard capacitors listed are hermetically sealed after vacuum process and both gross leak and helium leak tested for true hermeticity. Unless otherwise specified all parts listed are metal cased, tubular, with both wire terminals isolated from the metal case.

PART NUMBER OBSOLESCENCE — Due to changes in military specifications for which we are qualified, upgrading of our catalog specifications, or size reduction, part numbers formerly used may now be obsolete. We urge our customers to change their existing drawings to indicate the new part numbers for old and new design, wherever possible. If you are unable to make this change, CRC will continue to supply and mark parts indefinitely to the old specifications. See page 19.

INSTALLATION INSTRUCTIONS — To prevent damage to the hermetic seal joint, use a tweezer type heat sink between the soldering iron and solder beads when soldering within ¼″ of beads. Prior to lead bending or twisting, protect glass seals and solder joints by gripping with a small pliers, area of leads near solder beads.

Contaminating films on the glass seal surfaces may occur during customer handling and installation of capacitors. To preserve the high insulation resistance inherent in CRC capacitors, clean the glass seal surfaces thoroughly with acetone or chlorinated hydrocarbon fluid.

CAPACITOR MEASUREMENT INFORMATION — The high quality of CRC capacitors may be difficult to evaluate unless sufficiently sensitive and accurate equipment is utilized in conjunction with proper measurement techniques.

Capacitance bridges equal to the General Radio 1620A are recommended for best accuracy of capacitance. This bridge is satisfactory for dissipation factor measurement of capacitors up to 1 uF. CRC has developed a special bridge capable of accurately measuring dissipation factor of capacitors up to 100 uF or more at frequencies up to 1KHz. For inspection of DF of larger than 1 uF capacitors it is suggested that you use samples correlated by our measurement laboratory.

Insulation resistance measurement is performed by Component Research Co. using leakage current methods which are repeatable to 1 picoamp for capacitors less than 0.1 uF. Larger values require adequate charge time to minimize dielectric absorption effects. Guard boxes are used to perform leakage current and dielectric absorption measurements.

SPECIAL MATCHING — We can assort capacitors into sets of two or more capacitors matched for capacitance value within ±0.1% of each other at nominal cost. Where capacitors must track with temperature, they can be supplied in matched sets as closely at ±0.1% over their temperature range. Capacitors of opposing temperature coefficient slopes can be supplied to obtain lower temperature coefficients than for standard types.

SPECIAL CAPACITOR VALUES — If your application requires odd values such as 0.10015 uF ±0.1% or 0.9999 uF ±0.25%, such requirements are readily met from our large stock of standard and non-standard values. Individual capacitors can be permanently marked or tagged with discrete values accurate to six places if required.

SPECIAL VOLTAGE RATINGS — Problems of size may occur when replacement of a poor quality capacitor is required. Under certain conditions such as restricting the operating temperature, or limiting DC hipot to 150% of rated volts, a substantial size reduction is possible. Check with our applications engineering department for our recommendations in such cases.

SPECIAL PART NUMBER IDENTIFICATION — CRC believes that there is a sufficient choice of capacitors in this catalog to satisfy virtually all applications. In the event you have any requirement involving a modification of our specifications, the following special identification will be used.

Example: X11B154BW588 (typical special part number). "X" preceding the part number indicates a special customer requirement. The number group at the end of the part number is assigned as a unique identification of the special manufacturing and inspection instructions. In example shown, "588" is a typical unique identification number.

CRC HIGH RELIABILITY CAPACITORS	KEY CAPACITOR FEATURES
UNIQUE CONSTRUCTION	CRC capacitor windings are firmly supported within their hermetic enclosures to withstand high frequency shock and vibration levels per MIL-C-39022/9, and MIL-C-83421. The capacitors are uniquely constructed to provide winding support for the thinnest dielectric films, and have as well, stress free lead terminations that can withstand extended temperature cycling. CRC capacitors are exclusively manufactured under one or more of the following patents and additional patents pending: 3,238,428; 3,260,906; 3,292,063; 3,506,895; 3,539,886; 3,603,849; 3,626,362.
HIGH INSULATION RESISTANCE	Standard stock capacitors, 0.1 uF and less are rated up to 10,000,000 megohms for teflon, 5,000,000 megohms for polystyrene, and 3,000,000 megohms for polycarbonate and polysulfone types. If required, capacitors can be supplied with higher ratings for extremely critical applications. Thousands of such special teflon capacitors are in use in the attitude controls for the Boeing 747. Tests by the user during which the capacitors were left on charge for several years, indicate a capacitor self-time constant that exceeds 100 years.
LOW DIELECTRIC ABSORPTION	Special CRC equipment can perform this sensitive test at fast switching rates to determine how CRC capacitors will operate in critical sample and hold circuits. Recent tests on 1 uF capacitors using 10 milliseconds charge time, 1 millisecond discharge, and 100 milliseconds recovery time, indicate readings as low as 0.0035% for teflon and 0.007% for polystyrene capacitors.
LOW DISSIPATION FACTOR	A measure of the reliability and quality of the electrode terminations is determined by capacitor heat rise during 4 KHz to 40 KHz power measurements performed by CRC. Tests prove that the superior terminations of the CRC capacitors can be verified by their low 1 KHz and 10 KHz dissipation factor readings. The permanence of this quality has been further demonstrated by maintenance of low dissipation factor after temperature cycling, DC Life, AC Life, and all other environmental conditions. SEE PAGE 5, 7, 37
HIGH STABILITY LOW TEMPERATURE COEFFICIENT	The combined effects of CRC unique winding construction, temperature cycling and burn-in result in maximum stability, uniform TC linearity, and reproduceability. Capacitors can be supplied with virtually zero TC over limited temperature spans. SEE SPECIAL MATCHING PAGE 21.
HIGH RELIABILITY SCREENING	In addition to DC burn-in and 400 Hz RMS AC burn-in, CRC performs special burn-in at frequencies up to 40 KHz. 100% temperature cycling follows each burn-in sequence. In special AC applications, we provide 100% corona inception inspection at 150% to 200% of rated RMS AC volts. SEE PAGES 7, 18, 37.

TYPE B11B TEFLON CAPACITORS (Formerly 05TJ)

Test reports covering high reliability metallized teflon capacitors manufactured by Component Research Co. since 1962 show that these capacitors are still unequalled for low loss, stability and reliability.

The test data listed below is typical of the performance characteristics of CRC type B11B or C11B teflon capacitors, shown on pages 24 and 25 of this catalog.

Additional test data is on file which has been accumulated from qualification testing since 1963 for critical programs such as Apollo, Lunar Orbitor, Discoverer, etc.

If your application demands highest possible insulation resistance up to 125°C, and extreme low loss characteristics, we suggest series 11 teflon capacitors. For high RMS AC current applications see series 51 teflon or contact a CRC applications engineer at the address shown at bottom of page for further details.

TYPE B11B LIFE TEST SUMMARY

Summary data shown below covers 85 precision teflon 50VDC capacitors, life tested for 1000 hours at 125°C, with 70VDC applied. There were no failures for all capacitors tested. Data has been extracted from CRC test reports 70TR12, 71TR18, 71TR19, 71TR20 and 71TR21.

The X51 500 volt teflon capacitors were specially designed to provide low loss high frequency AC characteristics in small package size. Our customer was having difficulty with catastrophic failure, drift and overheating using ordinary capacitors but the CRC X51 capacitors solved these problems and improved circuit performance considerably.

Table at left is part of X51 screening and processing performed on a 100% basis.

SPECIAL TYPE "JW" TEFLON CAPACITORS (For Apollo)

The series 11 teflon capacitors listed in this catalog are of the same construction and are similar in performance to the "JW" teflon capacitors.

The "JW" capacitors were specially screened to meet critical Apollo requirements and were an important factor in maintenance of precise guidance and control for Apollo flights.

Life test data is shown as a demonstration of the excellent performance of our earlier teflon high reliability capacitors.

The newer series 11 teflon capacitors are now available at much lower cost than the "JW" capacitors and have even greater reliability as a result of added years of manufacturing experience.

TYPE "JW" LIFE TEST SUMMARY

The summary data shown below covers 100 precision teflon capacitors consisting of 50 05JW2233G (0.22 uF 50VDC 2%) and 50 05JW224G (.22 uF 50VDC 2%) capacitors that were life tested for 2,000 hours at 125°C and at 75VDC. There were no failures for all the capacitors tested. Data has been extracted from CRC Test Report No. 5-534.

SPECIAL MINIATURE SERIES N13 POLYSTYRENE CAPACITORS

Component Research Co. has developed a new product line of special Metallized Polystyrene Capacitors, Type N13, which are approximately 50% smaller in size than the N53 Series. The N13 capacitors have the same high quality, high performance features as Series 53 and will ultimately be qualified to established reliability specification MIL-C-83421. The unique patented construction and process features of CRC capacitors have been incorporated into the N13 Series which makes them the most reliable and miniature Polystyrene capacitors available for aerospace or industrial applications. The N13 Series has a low dissipation factor of 0.02% maximum and can be fully operated to 85°C reliably without voltage derating.

We believe the N13 Series will be useful in airborne applications where the N53 Series are too large in size and weight or where the Series 12 Polycarbonate have too high a dielectric absorption or too low an insulation resistance. Please contact our sales office for further information.

N53 POLYSTYRENE APPLICATION NOTES

Medical Research Laboratories, Industrial Research Institutes and Instrumentation Manufacturers find our N53 polystyrene capacitors are their favorite choice for integrating and other memory applications.

The N53B105KXC 1 uF, 50VDC capacitor shown below is, 0.750″ x 1.875″ hermetically sealed, and helium leak tested to maintain its low loss characteristics for long term use.

Typically, this capacitor exhibits less than 0.01 nanoamps leakage current at 25°C ±20°C with 10VDC applied. The low dielectric absorption, low dissipation factor and excellent capacitance stability with time, makes this capacitor ideal for laboratory and critical industrial applications.

N53 polystyrene capacitors are available in bathtub cases and custom designed metal cases where capacitance values above the standard values listed on catalog page 33 are needed.

Capacitors up to 100 uF of extremely high quality can be supplied to meet individual customer requirements.

The N53B106B 10 uF, 50VDC polystyrene capacitor shown below is approximately 2.25″ x 2.88″ x 2″ high, plus the ⅜″ wide mounting flanges. Leakage current at 10VDC and at 25°C is less than 0.1 nanoamps.

A 10 uF 10% 50VDC, N53B106K capacitor domestic price is approximately $40.00 in quantities from 1-10 pieces.

Special polystyrene capacitors for high AC power resonating use, are also available with very low loss frequency characteristics and heavy duty terminations.

SPECIAL "L53" TYPE HIGH TEMPERATURE POLYSTYRENE CAPACITORS

CRC has developed miniature polystyrene capacitors that can safely be stored above 85°C. This has been made possible by the use of a combination of the CRC patented winding and termination construction, and special metal film electrodes which support the polystyrene dielectric in a stress-free manner at temperatures above 85°C (CRC patent pending.)

Although CRC is confident that operation is possible at temperatures up to 105°C, (some lots have been operated at 125°C) we recommend that the normal operating temperature range be limited from −65°C to 85°C. This recommendation is not based upon any reliability problems at 105°C, but is rather due to a slight capacitance offset (called TC Hysteresis) that occurs when operated or stored above 85°C. The L53 polystyrene capacitors have an unusually linear temperature coefficient slope from −55°C to 85°C. Their retrace is superb and we believe this type will be excellent for low cost standards which we now supply for laboratory use.

As of February 1971 a total of 40 capacitors ranging from 0.0022 MFD to 0.01 MFD consisting of 50 and 100 volts DC rated units were subjected to a Reliability Demonstration test for a total of 2,000 hours at 105°C and at 100% of the rated DC voltage. All the capacitors also received a total of 75 temperature cycles from −62°C to +85°C in order to further stress the terminations of these capacitors. The capacitors were then visually inspected, seal tested and electrically inspected.

The capacitors indicated no significant Δ% capacitance, % DF and IR changes and there were no opens or shorts as indicated by the measurements shown in the table below. CRC will be conducting further testing on larger quantities of capacitors covering wider microfarad and voltage ranges in order to determine the proper ratings for these unusually reliable high temperature polystyrene capacitors. See page 37.

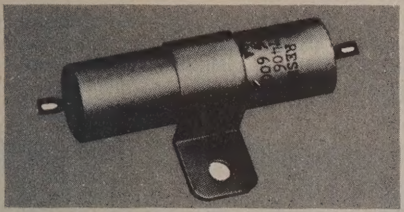
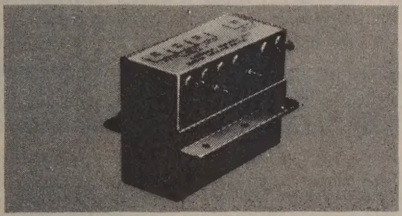
SPECIAL CAPACITOR APPLICATION SECTION

POWER RESONATING • SCR COMMUTATING • PULSE FORMING • AC ORDERING INFORMATION



The 0.033 uF, 2%, 600VDC, polystyrene capacitor shown is .562″ x 1.875″ size and is rated at 1.5 AMPS RMS AC. The capacitor is designed to handle 300V RMS AC at frequencies up to 25,000 Hz and to simultaneously withstand rugged environmental testing for a high reliability underseas application.

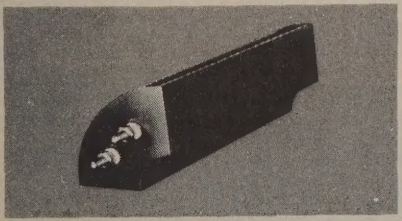
During operation and extreme environmental conditions the capacitor must not exhibit microphonics, noise, or corona and the short or long term capacitance drift must be maintained to very close limits. In many applications, burn-in under AC conditions similar to customer use can be performed as a 100% screening procedure.



In this application, high quality foil polypropylene and polystyrene capacitors were used to provide precise three phase motor control of a critical underwater guidance system. The capacitors must withstand transient voltage and current spikes during severe environmental stress without affecting reliability.

The highest quality materials are used including RTV silicone rubber potting compounds which are carefully lot controlled and processed to provide excellent electrical properties and extended life.

Typically the capacitors operate at 180V RMS from 400 Hz to 1200 Hz and must also withstand transients of 500 volts per millisecond under pulse peak to peak conditions of 800 volts.



As an example of CRC design of special purpose capacitors, four, quarter round capacitors were assembled to form a coaxial capacitor with a 2″ I.D. hole. Through this hole a copper pipe is passed with a circulating coolant to remove the heat generated due to the watts-loss of the capacitors.

In this application all parts were custom designed to provide low loss including special terminals capable of handling 100 AMPS RMS with minimum heating.

Special capacitors can be supplied to handle peak currents ranging into thousands of amperes for short periods in the microsecond region.

CRC patented capacitor designs provide the lowest possible loss, the highest reliability, consistent with minimum package size and reasonable cost.

CRC has over 150 KVA of AC power generators in constant use for power burn-in and life test of capacitors from 400 Hz to 40 KHz. Our present plans are to double this power generating capability with a view to CRC becoming a world leader in the development and manufacture of finest quality AC capacitors as well as CRC standard precision capacitors.

LIFE TEST DATA Series 14 Polysulfone Capacitors

Polysulfone, one of our newer dielectric materials, has many advantages to offer in terms of extended temperature range, and low temperature coefficient of capacitance.

In accordance with the CRC established policy of introducing new products with conservative ratings, life testing has been conducted at 125°C and at ratings that we believe will provide reliable, high quality polysulfone capacitors. Our new series 14 polysulfone specifications are in line with this policy, and are based upon the manufacture and test of thousands of polysulfone capacitors since 1970.

In addition to AC life tests, DC life at higher temperatures and voltage levels are in process. Future catalog issues will undoubtedly contain additional polysulfone specifications and life test data at extended conditions.

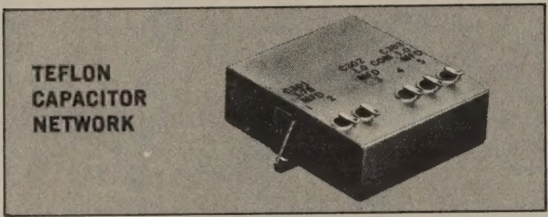
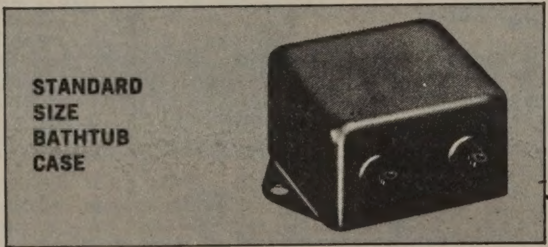
SPECIAL CAPACITOR TYPES High Energy AC Ultra High IR DC



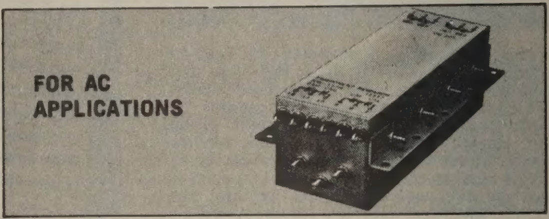
TEFLON CAPACITOR NETWORK: This teflon memory and computing network is one of the most critical components in the Lance Missile System. The capacitors must maintain very high insulation resistance, low dielectric absorption, and low capacitance change with temperature during storage and all through the severe environments of launching.

The capacitors are also specially designed to be free from mechanically induced noise which could affect the highly advanced and sensitive electronics control of the missile guidance. Testimonial letters from our customers are on file attesting to the unusually high quality and performance they have experienced in using our products.



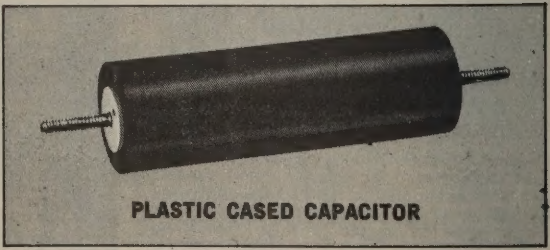
STANDARD SIZE BATHTUB CASES provide a quicker, convenient, lower cost method of providing special type capacitors for applications not satisfied by our standard metal cased tubular capacitors. Special capacitors of this type can frequently be shipped within three weeks of order, manufactured with a choice of dielectric materials, construction, % tolerance range, voltage ratings, and special performance characteristics that is virtually limitless in scope.

Due to a special matching and trimming technique, extremely accurate capacitors can be provided in bathtub cases at lower cost than an equivalent accuracy in our tubular style capacitors.



CAPACITORS DESIGNED FOR AC APPLICATIONS by CRC have very low equivalent series resistance and are remarkably cool and efficient for their size. The capacitor shown contains eight 1.2 MFD sections that operate up to 25 KHz at 170 volts AC RMS maximum with 25 amps at 25% duty cycle for each capacitor.

CRC was selected as the manufacturer to produce this special capacitor because of the extreme reliability required for a weapons program.



CRC IS NOW CUSTOM MANUFACTURING PLASTIC CASED CAPACITORS of extremely low loss and minimum heat rise for very high current, high energy applications.

These capacitors are available in ratings from DC to 50 KHz and voltages of up to 5000 volts RMS AC. The capacitors are available with brass threaded terminals or a variety of high conductivity copper lugs for low inductance and effective heat sinking. All plastic cased capacitors are thoroughly sealed against atmospheric effects by a special vacuum encapsulation process.

A standard product line offering a range of case sizes, voltage ratings, and performance styles will soon be available for prompt delivery.

CRC HIGH RELIABILITY CAPACITORS

Component Research capacitors are used in critical applications where their reliability and performance can affect the success of an entire program involving years of preparation and billions of dollars of program cost. For over a decade, aerospace programs from Apollo to Viking have used CRC capacitors for timing circuits and other control circuits, essential for controlling spacecraft millions of miles from earth, after years of space travel.

You can depend upon CRC to provide the most reliable capacitor and screening plan for your critical applications. Following are typical screening plans for standard and special applications.

VIKING QUALIFIED POLYSULFONE

G14 Polysulfone capacitors are the H14 series listed on pages 38 and 39 with 48 hours burn-in at 150°C followed by 10 thermal aging cycles from −65°C to +125°C. A specially screened G14 type has been supplied for the Viking space program which must withstand 135°C sterilization temperatures for 600 hours, very high levels of shock and vibration, and then perform in a very high impedance circuit at low voltage levels without intermittent conditions developing. During such tests some capacitors have been observed to develop problems at low temperature and special screening methods are used in this super-critical application to 100% monitor for breakdowns during temperature cycling.

400 HZ AC BURN-IN

R12 Polycarbonate capacitors are the same as the series 12 capacitors listed in the catalog except for 100% AC burn-in at 140% of rated RMS volts at 400 Hz for 16 hours at 100°C. The 400 Hz AC testing is becoming popular as a means of achieving high reliability in aircraft programs where a faulty capacitor could lead to serious consequences. The R12 type of screening will ultimately become a standard burn-in method of testing AC capacitors for MIL-C-83421. 100% recorded readings of capacitance, dissipation factor, and insulation resistance, can be provided, before and after burn-in.

40 KHZ BURN-IN & CORONA SCREENING

Type BF51 teflon foil capacitors are being used in a high frequency switching application with a rise time of less than 1 microsecond, in a limited space. Typically a 0.025 uF, 400 VDC rated teflon foil, oil impregnated capacitor operates with; 200 volt peak to peak, 10 KHz square wave voltage conditions, a rise and fall time of 100 nanoseconds, in a 0.312 x 1.063 case. Under these conditions this teflon capacitor is relatively cool with peak current of 30 amps developed at a 20 KHz repetition rate.

Following is the 100% screening used for this AC application.

1. **Burn-in** for 48 hours at 125°C. Apply 180 VRMS at 40 KHz ±5%.
2. **Thermal aging** temperature cycle 5 times −65°C to +125°C. Per MIL-C-83421.
3. **Seal Test** Bake for 4 hours at 125°C. Check for oil leakage or visual damage.
4. **Corona Test** Apply 400 VRMS at 60 Hz and check for evidence of corona inception.
5. **AC Stress Test** Apply 100 Hz square wave voltage, terminal to terminal, for 1 minute, per MIL-C-83421/1, at 1000 volts peak to peak.
6. **DC Hipot** Apply 800 VDC terminal to terminal and to case at 25°C for 1 minute, per MIL-C-83421.
7. **Insulation Resistance** when measured wtih 400 VDC at 25°C, 1,000,000 megohms minimum.
8. **% Capacitance** at 1 KHz.
9. **% Dissipation factor** at 10 KHz, 0.01% maximum.
10. **Final visual** and mechanical inspection.

SPECIAL SCREENING FOR CRITICAL APPLICATIONS

40 KHZ AC BURN-IN

Special 40 KHz burn-in for type 12 polycarbonate capacitors is available at maximum rated conditions of the RMS AC voltage conditions of Table I of MIL-C-83421/1. Typically, a 0.1 uF, 30 VDC rated type C12A104 or A12A104 is receiving 22 volts RMS AC at 40 KHz, at 85°C, for 168 hours, a special screening for the Trident program.

SCREENING FOR SPACE APPLICATIONS

Type J11 teflon and J12 polycarbonate capacitors receive 96 hours burn-in and other screening conditions as required by JPL for their space applications. If you have a JPL or similar space agency subcontract, we will be happy to coordinate capacitor specification preparation to facilitate procurement with minimum delay and effort.

105°C SCREENED POLYSTYRENE CAPACITORS

Series L53 105°C screened polystyrene capacitors are one of the many unique Component Research capacitor products which demonstrate CRC superior performance and outstanding quality. The following screening plan for a space application is typical of the many custom screening procedures we have available for the most critical and sophisticated applications.

H14 SPECIFICATIONS

OPERATING TEMPERATURE: −65°C to 125°C at full rated voltage. Derate linearly from 125°C to 50% of rated voltage at 150°C.

TEMPERATURE COEFFICIENT: 25°C reference

−0.5% ±0.2% at −50°C	0.00% ±0.2% at +75°C
−0.2% ±0.15% at −25°C	+0.10% ±0.3% at +100°C
0.0% ±0.1% at 0°C	+0.30% ±0.5% at +125°C
0.0% ±0.1% at +50°C	+0.50% ±0.7% at +150°C

STABILITY: Capacitance values measured at any two corresponding temperature points taken in five successive temperature cycles shall be as follows:

RANGE	RETRACE
−25°C to +85°C	.05% Max.
−65°C to +150°C	0.2% Max.

INSULATION RESISTANCE: Measured from terminal to terminal at rated voltage, and 5 minutes maximum charge time. For values greater than 1 uF, allow an additional minute/uF charge time.

MINIMUM IR

Range	25°C/50°C	75°C	100°C	125°C	150°C
.001 to 0.1 uF (in Megohms)	3,000,000	1,000,000	100,000	20,000	5,000
Greater than 0.1 uF (in Megohms — uF)	300,000	100,000	10,000	2,000	500

Readings shown are for 1 uF or less. For values over 1 uF, divide readings by uF to obtain min IR.

Example: An 8 uF capacitor is 37,500 megohms at 25°C.

DIELECTRIC ABSORPTION: 0.2% Max. at 25°C.

DISSIPATION FACTOR: 0.15% Max. at 1 KHz and 25°C. Values greater than 1 uF measure at 0.1 KHz.

DIELECTRIC STRENGTH: 200% of rated DC volts.

CONSTRUCTION: Polysulfone Dielectric, extended metal film electrodes, hermetically sealed metal tubular case, leads isolated from case.

COMPARISON CHART FOR MIL-SPECIFICATION TYPE METALLIZED POLYCARBONATE CAPACITORS

Component Research Company has prepared this capacitor performance and characteristics chart in order for engineers to clearly see what choice in specification limits and screening is available in the established reliability Mil-Specifications for Metallized Polycarbonate Capacitors.

Due to possible ambiguity in specification wording, both manufacturer and user may not be following the specifications faithfully in carrying out the intent of the military requirements.

500 cycles of thermal shock from −65°C to 125°C have been completed for the Space Shuttle Program, on a range of metallized Polycarbonate capacitors. Test results have been excellent and are available upon request.

COMPARISON CHART FOR MIL-SPECIFICATION TYPE METALLIZED POLYCARBONATE CAPACITORS

CRC
CATALOG SUPPLEMENT

A study of the dissipation factor limits and the AC ratings shows that only the MIL-C-83421/1 and MIL-C-39022/9C can be reliably used for AC applications, if we consider dissipation factor critical.

Although the dissipation factor limits for MIL-C-39022/9C styles CHR01B, E, H, L, P, C, F, J, M and R are listed as greater than 0.15% every M39022/9C shipped by Component Research Company is certified to be less than 0.15%, because we feel any value higher than this will result in unreliable life in AC applications, and possibly intermittent life in DC applications. Catalog supplement sections go into greater detail on this matter.

Please note that the 100% screening performed by Component Research Company using 0.15% maximum % dissipation factor, is an additional assurance of high termination quality, which established reliability Mil-Specifications do not always assure.

LONG TERM THERMAL AGING TEST REPORT
DATA COVERS 400 TEMPERATURE CYCLES

Thirty series C12A, 30VDC, Metallized Polycarbonate Capacitors were selected from current production and submitted to thermal aging PER MIL-C-83421/1 to determine the effects of continuous temperature cycling for 1000 cycles on dissipation factor, capacitance, and insulation resistance. As of publication date, parts completed 400 cycles from −65°C to +125°C with no evidence of visual damage, catastrophic failure, or any intermittent type measurement indication.

We have completed for the Space Shuttle Program, on a range of metallized Polycarbonate capacitors, 500 cycles of thermal shock from −65°C to 125°C. Test results have been excellent and are available upon request.

The capacitors tested are identical in construction with series A12A and K12A supplied to MIL-C-83421/1 and C12A, E12A, supplied to MIL-C-39022/9C. The only differences that exist are in screening and conditioning. This results in better stability for types with more extensive conditioning.

HOW TO ANTICIPATE FAILURES & IMPROVE CAPACITOR RELIABILITY BY 100% SCREENING

Plastic film dielectric type capacitors can provide remarkably good electrical characteristics and high reliability but it takes a combination of sound construction, suitable film quality, exacting process control, and 100% testing to achieve this.

We are listing below some pitfalls to avoid because we are concerned with a proliferation of marginal quality capacitors frequently used in high reliability level Aerospace and industrial applications. Additional information appears on pages 7 and 37 of catalog "JB".

MIS-APPLICATION OF CAPACITORS IN AC CIRCUITS

To begin with, the highest quality capacitor will fail if you are exceeding its ratings by subjecting it to excessive voltage and current stresses. In sinusoidal applications metallized capacitors that warm up over 20°C after several hours of operation are considered a borderline case, and you may be applying too high an RMS voltage or frequency. Consult the AC ratings in MIL-C-83421/1 for metallized polycarbonate capacitors as a guide to typical limits.

If the capacitors you are using have higher than normal dissipation factor readings, this may be a sign of high series resistance caused by poor terminations on the capacitor section. The square wave AC screening for one minute covered in MIL-C-83421/1 is a good way of eliminating capacitors with gross dissipation factor quality.

Unfortunately, if dissipation factor limits are set too high as post test requirements, suspect capacitors will pass the square wave test, in fact may have been damaged by this test, but are permitted to pass what we consider are abnormally high DF limits.

A termination that is poor at room temperature generally should be worse at higher temperature and increased heating caused by power loss at the terminations may cause ultimate degeneration and possible explosion.

We consider 100% AC burn-in at elevated temperature an excellent method of checking for good terminations. Burn-in should be followed by 100% dissipation factor examination. See page 37 for special AC screening information.

In SCR commutation and transistor switching type applications, heat rise of a metallized capacitor is not always a good means of determining if the capacitor can handle the non-sinusoidal current pulses usually encountered if the capacitor is subjected to relatively high peak currents at a low duty cycle; it may suddenly open after hours, possibly months of operation and never may have shown more than a few degrees warm-up during operation.

A recent example of operating beyond specified limits resulting in ultimate failure is shown by the following experiment performed on three 0.033μF, 30VDC, Type E12A333, metallized polycarbonate capacitors. Each capacitor has nominal case dimensions of 0.170″ diameter by 0.562″ length and #22 AWG wire leads.

The capacitors were placed in parallel to form a 0.1μF load into the output of a CRC designed power generator supplying a 60 volt peak to peak square wave at a 20KHz repetition rate.

An examination of the current pulses developed indicated that the capacitors were handling a peak current of 8.4 amps with a cosine type waveshape having a 1.2μ second width at the base.

The capacitors were operated for 100 hours at 25°C with less than 2°C heat rise. If we compare the MIL-C-83421/1 rated current at 40KHz of 0.18A rms maximum for a 0.033μF 30VDC capacitors, with the

HOW TO ANTICIPATE FAILURES & IMPROVE CAPACITOR RELIABILITY BY 100% SCREENING

peak current of 2.8 amps during this test, it appears that these capacitors can handle this level.

A more conservative level which we intend to verify by long term testing is 1.8 amps maximum peak current based on a peak current not to exceed ten times the 40KHz rms rated current of 0.18A for this capacitor. After increasing the square wave voltage to 80 volts peak to peak, the capacitors opened up.

The peak current during this test period was approximately 3.8 amps which is more than twenty times the RMS rated current of 0.18 amps. This is an example of how much higher in peak current CRC capacitors can be stressed, but certainly we do not recommend that you go to extremes in using these capacitors.

We recommend that you send us your oscilloscope current and voltage waveforms for analysis if you have non-sinusoidal applications. (See page 35, Catalog "J".) We are currently undergoing a test program to confirm that it is safe to operate our metallized polycarbonate capacitors under non-sinusoidal conditions of a 1μ second current pulse width at a 10KHz repetition rate providing the peak currents do not exceed ten times their maximum AC ratings at 40KHz.

As an example a 0.1μF 100VDC rated E12C104 or K12C104 capacitor maximum rated at 0.9A rms could be operated with 9 amps of peak current provided you did not exceed a 10KHz repetition rate.

Component Research Company bases the above as a result of many other tests and customer usage. We will of course continue to increase our test scope covering non-sinusoidal operation and publish operating specifications for such conditions.

CAPACITOR OPENS & INTERMITTENTS AFTER ENVIRONMENTAL TESTING OR LONG TERM STORAGE

CRC has frequently been requested to replace "Brand X" metallized capacitors (which may have cost 50% less). Problems began to plague production lines long after being qualified for the application and long after passing initial breadboard and preproduction tests.

Unfortunately many specifications and programs do not take time into consideration. Capacitor terminations may withstand DC burn-in, DC life, and even AC life but may start to break down as a result of expansion and contraction of all the metal and plastic materials involved in the construction of a capacitor.

The extreme differences in dimensional change between plastic and metal materials as a result of temperature cycling may result in microscopic ruptures of termination joints, possible electrode oxidation and generally unstable termination series resistance.

Component Research Company patented stress free termination design and precise quality control eliminates the above problems. This is the reason we recommend 100% temperature cycling or thermal aging followed by screening as described above.

Our goal is to continue to provide increasing amounts of detailed information and data of this type. In this manner the reliability and safety of electronic equipment needed for military and commercial transportation or general usage equipment will be enhanced and maintained.

Please contact us if you have any suggestions how to further this goal.

DC LIFE TEST DATA FOR METALLIZED TEFLON VIBRATION REPORT FOR METALLIZED POLYCARBONATE

TEST REPORT No. XT907

In this test, thirty metallized Teflon Capacitors, part number D11B504, 0.5μF, 50VDC, in a 0.562" x 1.125" case size were subjected to DC life testing at 140% of rated voltage at 125°C. At the conclusion of 7300 hours of test the capacitors changed less than 0.5% in capacitance. There was an increase in dissipation factor to 0.12% maximum for serial number 017. Twenty-one other units remained within 0.05% dissipation factor. The dissipation factor increase is not significant for DC applications where there is a relatively small AC current content. We do not recommend this type of Teflon Capacitor for high current handling AC applications. We can supply very stable, Teflon Foil Capacitors which are capable of handling over 100 AMPS RMS per microfarad and several thousand peak amperes, if required.

The insulation resistance measured from 500,000 MEGS-μF to 12,000,000 MEGS-μF, and this we consider superb performance. As can be seen it is now possible to supply high reliability, high insulation resistance, low capacitance drift Teflon capacitors to specification limits far beyond the scope of present specifications if a program requires such performance.

HIGH LEVEL VIBRATION TEST REPORT #644-1-74-152 FOR SPECIAL C12 POLYCARBONATE CAPACITORS

Component Research Company became involved in the development of C12A Metallized Polycarbonate capacitors capable of handling very high vibration levels, as a consequence of capacitor failures in the Atlas Centaur Program.

In this application we replaced other capacitors. Thus CRC provided far superior electrical performance, as well as rugged construction. And all this within a minimum of lead time.

During this test three samples of each case size covering the range of capacitor values to be qualified, while using random vibration, were subjected to a level of 35 grms and 70 grms. These levels were performed from 100 Hz to 1000 Hz by the contractor and no failures occurred.

VIKING ULTRA HIGH RELIABILITY TEFLON CAPACITOR SPECIFICATIONS

CATALOG SUPPLEMENT

Component Research Co. is proud to have been selected for Viking sole source procurement of extremely accurate, high quality teflon capacitors similar to the B11B and B11C series shown on pages 24 and 25 of catalog JB.

Critical weight limitations prevent the use of redundant circuits. The capacitors must maintain their excellent performance with 600 hours of spacecraft sterilization, severe shock and vibration levels at launching and five to ten years of space travel. A single capacitor failure may mean a major setback to one of the most important and complex space ventures known to man.

Component Research Co. accepts this challenge with a confidence based upon over a decade of experience in the manufacture of high quality, high reliability film capacitors.

OPTIONS AVAILABLE FOR STANDARD CAPACITORS

CRC can supply the standard capacitors listed in this catalog with more closely specified limits and with special characteristics by additional processing, screening, and selection. Following is a list of some options and characteristics available when you are required to meet special design or operating conditions.

LINEAR TC SLOPE FOR RESISTOR MATCHING

CRC series N53 polystyrene capacitors provide the closest approximation to a straight line plot for capacitance vs temperature over the range of −50°C to +85°C, with less than 150PPM/°C in negative slope. Larger capacitor values appear to have lower TC than smaller capacitor values. Typically values ranging 0.01uF average −100PPM/°C and 1.0uF range −40 PPM/°C. The normal worst case limits in non-linearity of TC slope are ±50PPM/°C for all N53 polystyrene capacitors. Slopes are available as low as ±10PPM/°C for the full temperature range of −50° to +85°C. This slope is a permanent characteristic and will remain constant with temperature cycling and time.

CRC series N55 metallized polypropylene capacitors have a more negative slope, generally −300PPM/°C with linearity limits of ± 50 PPM/°C. CRC foil polypropylene capacitors which are not oil impregnated generally have a TC slope of −225 PPM/°C. Foil capacitors also have a greater dielectric hysteresis than metallized types which evidences itself by a capacitance shift at 25°C when a capacitor is alternately cycled from cold to hot temperatures.

Typically this offset is from 0.01% to 0.15% for metallized capacitors when measured at 25° after exposure to −50°C and +125°C. Foil capacitors usually have an offset of 0.05% to 0.25% under the same conditions. Operation over a more limited temperature range results in a reduced offset.

CRC can provide capacitors with minimum offset and specific linearities and slopes by 100% screening and selection.

±10 PPM/°C TRACKING MATCHED CAPACITORS

In some applications it is desirable to have several capacitors of the same value track together over a specified temperature range.

Frequently good linearity is not mandatory provided all capacitors although non-linear, follow the same pattern of varying in capacitance with temperature. In other applications a set of different capacitors must track within a defined ratio limit of each other as temperature changes.

From its large stock of 100% screened and batch controlled high reliability capacitors, CRC can furnish many combinations of desired matched capacitors in a minimum of time.

MATCHED SETS TO ± 0.05% ACCURACY

CRC can provide matched sets of two or more capacitors with readings of ±0.05% of each other although the purchase tolerance is as high as ±1%. This is more economical than purchasing individual capacitors to ±0.1% or ±.25% tolerances.

0.003% DIELECTRIC ABSORPTION CAPACITORS

Special teflon capacitors having less than 0.003% dielectric absorption are available for minimum offset error in sample and hold type applications.

In one special application 1uF teflon capacitors are 100% screened by viewing their individual slopes of recovery voltage on an oscilloscope. These capacitors receive a 10 volt peak pulse, ten milliseconds wide, with a 1 millisecond discharge time. The oscilloscope indicates the recovery voltage for an additional 100 milliseconds. This test method more closely approximates fast switching application conditions than the dielectric absorption test methods covered in military specifications.

ZERO TEMPERATURE COEFFICIENT BY TC MATCHED PAIRS

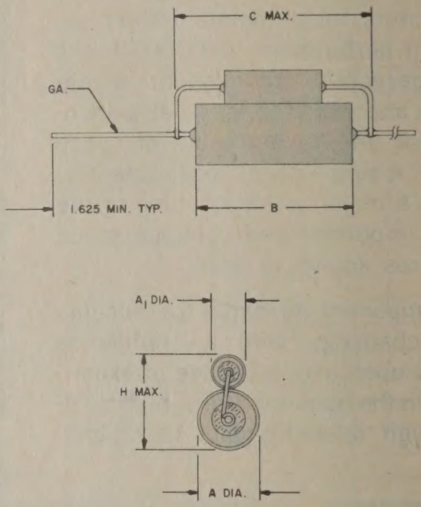
It is difficult to obtain zero TC over a wide temperature range but over a more limited range CRC can provide a TC as low as zero ± 5PPM/°C by pairing two capacitors with opposing slopes. Typically an N53 polystyrene capacitor matched with the same value C12 polycarbonate capacitor will match to zero ± 30PPM/°C from −10°C to +85°C, as off the shelf purchased items.

If lower TC than this is required, we can 100% measure and match for closer temperature coefficient.

"PIGGYBACK" PERMANENTLY CONNECTED MATCHED CAPACITORS

Customers sometimes prefer the matched capacitors connected together as one to prevent their separation prior to installation. CRC standards are made by "piggyback" connection of trimmers which can provide accuracies to ±0.05%.

Shown below is a figure of a "piggyback" connected matched capacitor.



50,000,000 MEGOHMS INSULATION RESISTANCE

This may seem incredible but CRC is supplying special 1uF teflon capacitors which measure up to 5,000,000 megohms at 100°C, and up to 50,000,000 megohms at temperatures from 25°C to −40°C.

CRC is developing new methods of measuring to higher levels of insulation resistance and believes it will be able to verify that specially selected smaller values such as 0.1uF can be supplied to meet a specification of 500,000,000 megohms. When you use capacitors in such sensitive applications certain errors and disturbances not normally observed become visible. Some of these are described below.

LOW "PIEZO ELECTRIC LIKE" VOLTAGE GENERATION CAPACITORS

When capacitors are subjected to a temperature change they generate a voltage which may vary from capacitor to capacitor in a lot and from one style of capacitor to another. Voltages up to ten millivolts per °C have been observed and the voltage output generally does not increase linearly with temperature. In some cases there actually will be voltage reversal during a temperature run in a given direction.

If the capacitor is not connected to a high impedance measurement device during the tests this voltage output may not be seen as it will be discharging through the low resistance input of ordinary voltmeters if these are being used for measurement. CRC supplies specially selected 0.5uF, 50VDC teflon capacitors similar to the D11B504 style to meet a requirement of 0.5 millivolts maximum/°C voltage generation, for a critical application.

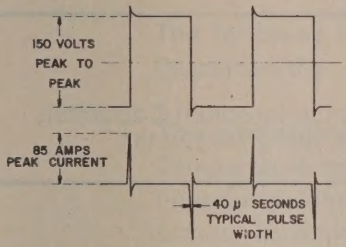
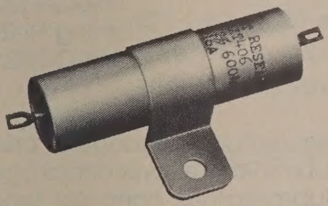
MIL-C-83421/1 QUALIFIED (SUPERMETALLIZED)

40 KHz AC rated, metallized polycarbonate capacitors qualified to MIL-C-83421/1 and MIL-C-39022/9C are available from stock. Because of superior performance they are titled "SUPERMETALLIZED." They are 100% reliability screened. For the Trident program, 30 VDC rated capacitors receive 168 hours of AC burn-in at 22 Vrms, 40 KHz, and 100°C.

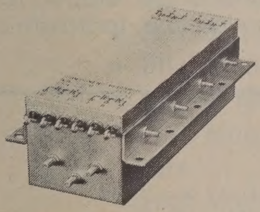


Component Research Company developed this AC dielectric withstanding test for use in MIL-C-39022/9 which was then superseded by MIL-C-83421/1. This test assists in early detection of abnormally high dissipation factor and high ESR. The voltage square wave when applied to each capacitor proves the ability of the terminations to withstand relatively high peak and RMS current.

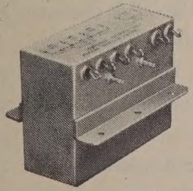
Typical voltage and peak current waveforms shown at left for A12B106, 10 μF, 50 V, metallized polycarbonate capacitor during the one minute AC square wave screening at 100 Hz.



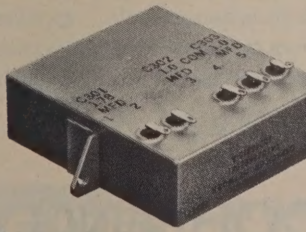
The .033 μF polystyrene capacitor shown can handle 300 Vrms at 25 KHz and fits in a 0.562" x 1.875" metal case. The capacitor features: high Q, tight capacitance tolerance and drift, and low controlled temperature coefficient. Additional configurations are available which are smaller in size and have higher AC current ratings.



This polystyrene capacitor network contains 8 precisely matched 1.2 μF sections. Each capacitor section is capable of operating with 170 Vrms applied at 25 KHz, with low heat rise. This network is one of many critical components supplied by Component Research Company for major weapons systems.



Component Research Company foil-polypropylene capacitors are used for various AC applications. This capacitor network is used in a weapons system where utmost reliability is required. Lower cost types can also be supplied for industrial applications with complete AC rating information.



In 1965 Component Research Company developed this precision metallized capacitor network for very accurate guidance and control of a sophisticated missile system. These networks are still being purchased annually due to their superb proven performance in field use. Their unique characteristics are: high insulation resistance, low dielectric absorption, low temperature coefficient, and low noise during environmental exposure.

FEATURES

- Ultra low impedance above 10KHz
- Broad temperature range
- Low ESR (Equivalent Series Resistance)
- Shock and high frequency vibration resistant
- UFT* has No. 18 AWG and UFTA* No. 16 AWG leads

APPLICATIONS

- Designed for switching regulator power supplies
- High gain amplifiers
- Critical circuits where operation at high frequency is necessary yet still have a high degree of reliability and low failure rate under adverse environmental conditions.

The unique four terminal construction and internal assembly techniques dramatically reduce the inductance to approximately one nanohenry. As a result, the impedance does not increase at frequencies above 10KHz, but actually decreases to a value approximately equal to the ESR and then remains essentially flat as shown in the impedance-frequency curve. These capacitors also provide effective isolation of the load from the power source.

In a typical switching regulator power supply, UFT and UFTA capacitors perform the following functions:

1. Adequately filter the fundamental frequency ripple current.

2. Localize and filter the high frequency megahertz ripple.

3. Prevent high frequency noise from feeding back into the power line.

The UFT and UFTA are designed for continuous duty operation over the temperature range of −55°C to +105°C (−67°F to +221°F). They are shock and vibration resistant and unaffected by chlorinated cleaning solvents.

Capacitance ratings available are 50 to 16,000 Mfd. Voltage ratings available are 5 to 200 VDC at 105°C. The maximum capacitance change from the 25°C value over the temperature range of −55°C to +105°C is ±25%.

Unlike conventional axial lead capacitors, the DC current flows through the aluminum rods located in the center of the capacitors. Under certain conditions, up to 45 amperes DC load current can be handled. This current is limited by the temperature rise due to the DC load current and ripple current, the ambient temperature, and external loads.

The capacitors are capable of withstanding a minimum of 2000 hours life test at rated DC voltage and ripple current at 105°C.

Electrolytic Capacitors, Aluminum

CDE CORNELL-DUBILIER

EXTENDED TEMPERATURE RANGE (−55°C to +125°C)

The all-welded type UHL units are polarized, etched-foil aluminum electrolytic capacitors which operate over the broad temperature range of −55°C to +125°C (−67°F to +257°F), without derating. The all-aluminum construction offers minimum capacitor weight, suitable for airborne and space applications. UHL capacitors are dual voltage rated, allowing higher voltage operation at the lower ambient temperature of +85°C (+185°F). Maximum capacitance change at −55°C (−67°F) is −30% and +25% at +125°C (+257°F). Mil Style CU 12, CU 13 capacitors to Mil-C-39018/1A are available.

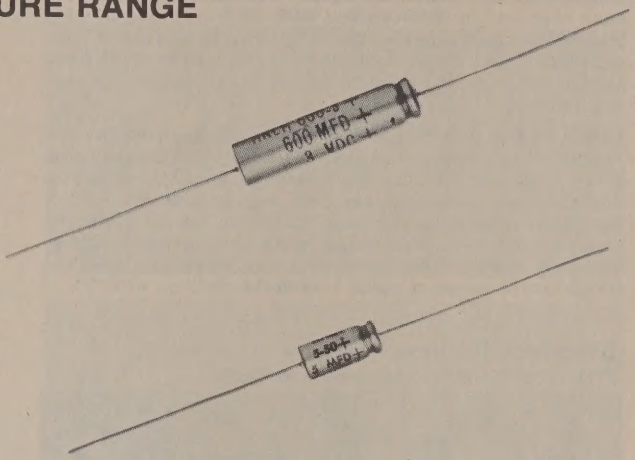
CDE CORNELL-DUBILIER

Electrolytic Capacitors, Aluminum

MINIATURE EXTENDED TEMPERATURE RANGE (−80°C to +110°C)

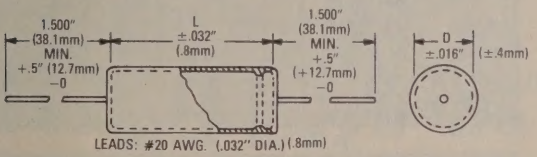


The all-welded type HNLH is a broad temperature range, low inductance, high reliability electrolytic capacitor featuring extremely low ESR and capacitance stability across the entire operating temperature range of −80°C to +110°C. (−112°F to +230°F). Sealed in a drawn aluminum case, these units are constructed with the highest purity etched cathodes and anodes, and the CDE exclusive cold-weld construction.

The HNLH is an ideal selection for input filters on computer cards, translator assemblies, memory decoders, as well as communication and instrumentation equipment.

Standard HNLH units are supplied with a polyester insulating sleeve and #20 AWG leads.

NOTE: D AND L = UNINSULATED DIMENSIONS



LEADS: #20 AWG. (.032″ DIA.) (.8mm)

Electrolytic Capacitors, Aluminum

CDE CORNELL-DUBILIER

COMPUTER GRADE, SCREW TERMINAL, EXTENDED CAPACITANCE, COMPUTAMITE® (−40° to +85°C)

The ratings shown are the highest nominal capacitance for each case size in the standard line. Intermediate, unlisted values are also available. The FAHM has "high screw" terminals, the FALM has "low screw" terminals, and both have tapped terminals to accept 10-32 screws furnished with each capacitor.

CDE's FAHM and FALM "Computamite" electrolytics are extended capacitance units with ratings which exceed those of the FAH and FAL. They are reliable, long-life capacitors designed for power supply filtering, industrial control equipment, energy storage, and other applications where the smallest size with high mfd x volts are important. These units are designed for continuous duty operation over the temperature range of −40°C to +85°C (−40°F to +185°F).

Type FAM | Class 210.24

COMPUTER GRADE, SCREW TERMINAL, LOW IMPEDANCE (−40°C to +85°C)

Developments by CDE in low resistance electrolytes and paper separators, combined with increased quantity of multiple anode and cathode tabs welded to the terminals, have resulted in very low ESR capacitors.

Another advantage of the design of the FAM is lower impedance at high frequencies, which is important for high ripple current applications such as switching power supply filtering.

The "low screw" terminals are tapped to accept 10-32 screws furnished with each capacitor.

The operating temperature range of this capacitor is from −40°C to +85°C (−40°F to +185°F)

The ratings shown are the highest nominal capacitance for each case size in the standard FAM line. Intermediate, unlisted values are also available.

STANDARD SERIES made of DuPont TEFLON®

For High Insulation Resistance on High Temperature Applications

Standard series capacitors of DuPont TEFLON® offers you an ultrastable, low loss, low temperature coefficient capacitor that is ideally suited for high insulation resistance requirements up to 200°C (Specials to 250°C).

Two different internal construction styles are offered to the circuit design engineer: **Extended Foil** - for use in high power resonant and pulse circuits. **Metalized Film** - for resistor coefficient matching and for use in subminiature circuits.

Standard leads are tinned copper-clad steel. Tubular cases are brass - 100% tinned.

Custom has what design engineers need . . . Depend on it. For FREE Facilities Brochure and Balco Product Bulletin T-1, write or call:

YESTERDAY'S RADIO MASTER IS TODAY'S

ELECTRONIC DISTRIBUTORS MASTER CATALOG

Known as O-T-S, OFF-THE-SHELF CATALOG until this edition, the MASTER CATALOG encompasses the following product areas: audio and communications equipment; electromechanical components; electronic circuit components and subassemblies; panel components and hardware; production equipment and tools; test instrumentation; power sources; wire and cable; and related materials and chemicals.

The MASTER CATALOG is broken down into four basic sections. **A GENERAL INDEX** which lists manufacturers and products alphabetically. **A MANUFACTURERS' CATALOG SECTION** which displays their respective product pages and lists their addresses and phone numbers. **A MANUFACTURERS' DIRECTORY,** where participating manufacturers, again listed alphabetically with addresses and phone numbers, highlight their distributors. And a **GEOGRAPHIC DISTRIBUTORS' DIRECTORY** which includes the names, addresses and phone numbers of the local distributors nationwide which stock the products of manufacturers whose data appears in the "Manufacturers' Catalog Section."

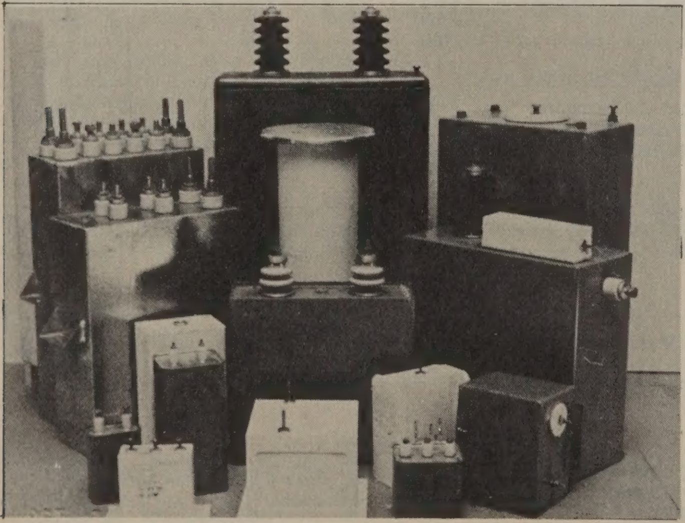
High Energy RF rated, ceramic transmitting capacitors are designed primarily for use in applications where very high R.F. currents, high KVA ratings and high working voltages exist. Special capacitor design reduces terminal self-inductance to permit higher frequency operation. A humidity resistant silicone coating and long flashover path assures safe, high voltage operation in free air. Units also feature stable temperature-capacitance characteristics and rugged mechanical construction for maximum reliability.

These capacitors are extensively used in transmitters, antennas, induction heaters, X-ray, diathermy and electronic welding equipment.



OIL FILLED CAPACITORS

High Energy encases the oil filled capacitors in heavy gauge steel which is heliarc welded to insure maximum strength. In addition, High Energy also uses a unique virtually indestructable high impact thermoplastic housing eliminating the need for insulators and allowing for considerable versatility in mounting. The plastic is inert gas welded designed to operate in high voltage dielectric gases including SF^6. The terminals are flush mounted female threaded inserts. High Energy also designs and manufactures many custom oil filled configurations. Consult the factory for information.

vacuum capacitors

ITT Jennings offers the broadest available line of high voltage capacitors for radio frequency applications. Units are available in glass and ceramic envelopes with working voltage ratings of 2 kv to 40 kv, at capacitance values to 5000 pfd, with current ranges to 250 Amps RMS (air-cooled) and 750 Amps RMS (water-cooled), depending upon capacity, frequency, and working voltage. The design of ITT Jennings Vacuum and Gas capacitors allows a number of electrical, mechanical and environmental advantages which include:

1) HIGH VOLTAGE—The high dielectric strength allows maximum voltage levels for a given capacitance rating.
2) HIGH CURRENT—Extremely low losses occur because of the dielectric, low loss glass and ceramic envelopes, and heavy copper construction. ITT Jennings capacitors are able to handle large currents at high RF frequencies that would destroy other types of capacitors.
3) COMPACT DESIGN—Units are quite small for their power handling capabilities.
4) HIGH Maximum to Minimum CAPACITY RATIO—Capacity change ratios are available to 150:1, making them desirable for wide tuning ranges.
5) SELF-HEALING—The design construction permits moderate overloads that would damage other materials.
6) HIGH ALTITUDE OPERATION—Vacuum capacitors are free from internal degradation due to extreme environmental conditions.

CTV SERIES TRIMMABLE-FIXED† VACUUM CAPACITORS FOR POWER APPLICATIONS — THE FIXED CAPACITOR YOU CAN TRIM

- Adjustment from 5% to 30% of nominal capacitance
- From 18 to 1377 pF in discrete steps
- Peak 60 Hz test voltages to 50 KV
- High current ratings — to 150 A rms
- Compact — 5.5″ long x 4.5″ dia.

These new devices offer designers a new means of achieving the exact capacitance required in high power circuits. Incorporating in one package a trimmer in parallel with a large fixed capacitance, they eliminate the need to use large, fully variable capacitors or the use of multiple fixed capacitors in many applications. They are ideal solutions for filter circuits, antenna phasing and matching networks in high power communications gear and for dielectric heaters and other high power RF equipment.

With ceramic envelope construction, they have fixed, concentric capacitor plates, in the core of which is a set of plates attached to a small sealed bellows which is adjusted by a screw. Because the trimmable section conducts only a small portion of the total current, these units have a very large current rating for their size.

They offer high "Q" . . . typically 2000 @ 150 MH$_2$ and exceptionally low temperature coefficient: Type T plus 30± 15 ppm/°C; Type U plus 45± 15 ppm/°C. Metal parts are silver-plated. Types U and V ceramic are steatite grade L-423 or better. Type T ceramic is 95% Alumina grade L-624 or better.

Type "T" Air Variable Capacitors

Designed to meet or exceed E1A-RS 204 and MIL-STD-202C methods 204 A and 201 A. Offer excellent retrace characteristics. Can be supplied with tuning slot on both ends of rotor. High temperature versions available as specials.

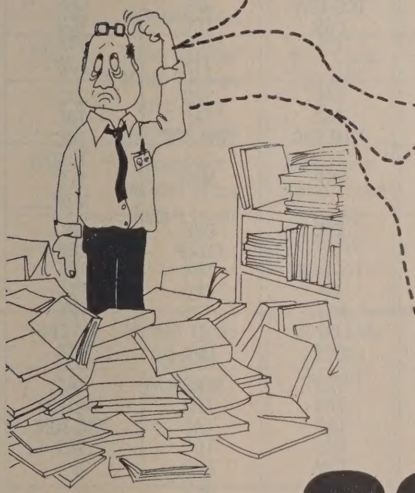
What can I use to keep all the manufacturers' product data I receive in order?

What system makes filing or retrieving manufacturers' catalogs fast and easy?

Which file system have thousands of engineers purchased because they know it works?



eem FILE SYSTEM

THE ONLY FILE SYSTEM DESIGNED SPECIALLY FOR THE ELECTRONIC ENGINEER!

The publishers of **eem** have put together a unique filing system for electronic product information. The complete system includes: a product index booklet which classifies electronic products into 3,000 listings both alphabetically and by product group, and 45 file folders imprinted with the **eem** product sections (extra gummed labels included for expanding the system.)

As you receive manufacturers' catalog data sheets, technical bulletins, or clip magazine articles, jot down the proper Product Section Numbers from the **eem** PRODUCT-TO-SECTION INDEX. Then simply file in order. When you require information on a specific product, refer to PRODUCT-TO-SECTION INDEX again to locate the correct file folder. It's simple, and you'll always have the necessary data to compare, specify and buy, right at your fingertips.

Here's how to order your eem FILE SYSTEM:

For the complete system send $10 (plus tax; N.Y., 8%, CA, 6½%) in check or money order to:

United Technical Publications, Inc.,
645 Stewart Avenue, Garden City, N.Y. 11530
Att: Circulation dept.

For an **eem FILE SYSTEM** without file folders send $7.50 (plus tax; N.Y. 8%; CA, 6½%).

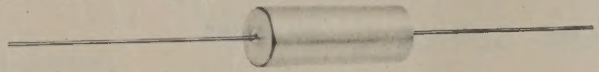
POLYESTER FILM CAPACITORS

POLYESTER FILM CAPACITORS EXTENDED FOIL/FILM WRAP/EPOXY END FILL STYLE 107 −55°C TO +125°C



ELECTRICAL AND ENVIRONMENTAL CHARACTERISTICS

CAPACITANCE MEASUREMENTS

Capacitors of 1.0 µF or less shall be measured at a frequency of 1000 Hz. Capacitors greater than 1.0 µF shall be measured at 60 Hz. The standard capacitance tolerance is 20%. Other tolerances are available upon request.

Reference: MIL-STD-202, Method 305.

TEMPERATURE CHARACTERISTICS

The maximum change in capacitance from the measured value at +25°C shall be −6% at −55°C, and +15% at +125°C.

DISSIPATION FACTOR

When measured as specified in Paragraph 1, the dissipation factor at +25°C shall not exceed 0.6% for values up to 1.0 µF and shall not exceed 1.0% for greater capacitance values.

INSULATION RESISTANCE

When measured at +25°C, and rated voltage (or 500 VDC, whichever is less), the insulation resistance shall be a minimum of 50,000 megohm-microfarads, but need not exceed 100,000 megohms. The period of electrification shall not exceed two minutes.

Reference: MIL-STD-202, Method 302.

VOLTAGE DERATING

The capacitors may be operated at full rated voltage from −55°C to +85°C, or with linear derating to 50% of rated voltage above +85°C with a maximum temperature of +125°C.

VOLTAGE TEST

When tested at +25°C, the capacitors shall withstand the indicated DC test voltages for a period of one minute:

Terminal to terminal	200% of DC rating
Terminal to case (less than .235 diameter)	200% of DC rating
Terminal to case (greater than .235 diameter)	400% of DC rating or 2,000 VDC, whichever is less

Reference: MIL-STD-202, Method 301.

LIFE TESTING

When tested for 1000 hours at 150% of the appropriate rated voltage for the test temperature, the capacitors shall exhibit no more than one failure in twelve pieces tested. Alternatively, an accelerated +125°C test may be performed at the +85°C voltage rating for a period of 250 hours. A failure is defined as:

a) A capacitance change of more than 10% of its initial value;
b) A dissipation factor greater than that specified in Paragraph 3;
c) An insulation resistance less than ⅓ that specified in Paragraph 4; or
d) A permanent open or short.

VIBRATION

The capacitors will meet or exceed in the vibration requirements of MIL-STD-202, Method 201.

Reference: MIL-STD-202, Method 301.

LIFE TESTING

When tested at 85°C for 250 hours at full 65°C rated voltage, the capacitors shall exhibit no more than one failure in twelve pieces tested. A failure is defined as:

a) A capacitance change of more than 6% of its initial value;
b) A dissipation factor greater than that specified in Paragraph 3;
c) An insulation resistance less than 60% that specified in Paragraph 4; or
d) A permanent open or short.

METALLIZED POLYESTER CAPACITORS TYPE 188 FILM WRAP / EPOXY END FILL −55°C TO +125°C

Type 188 Capacitors features extremely small size, light weight and self clearing metallized construction which virtually eliminates catastrophic failures. Well suited for Voltage Multiplier Circuits in TV power supplies and Electrostatic copiers. Also ideal for Potting or encapsulating in Electronic Sub assemblies, Power supplies, etc.

CAPACITANCE

Measurements shall be made at 1000 cycles per second for capacitance values thru 1. MFD and at 60 cycles per second for values over 1. MFD.

CAPACITANCE TOLERANCE

Standard capacitance tolerance is ±20% (M). Closer tolerances available upon request.

DISSIPATION FACTOR

The dissipation factor shall not exceed 1% when measured at 25°C. Measurements shall be made at 1000 Hz for capacitance values thru 1. MF and at 60 Hz for higher values.

TEST VOLTAGE

Capacitors shall withstand 200% of rated DC voltage for one minute at 25°, with the charging and discharge current limited to a maximum of 1. Ampere.

OPERATING TEMPERATURES

−55°C to +125°C.

LIFE TEST

Capacitors shall withstand a life test of 250 hours at 125°C, with 140% of the 125°C rated DC voltage applied. A resistance of one ohm per volt of applied voltage shall be inserted in series with the capacitor.

VOLTAGE DERATING

These capacitors will operate as full DC voltage ratings at 85°C. For operation at temperatures above 85°C, see Figure 4.

VIBRATION

Capacitors shall withstand a vibration test per Method 204, Test condition B of MIL-STD-202B as modified by MIL-C-27287. After test, the I.R. will be equal to or greater than 1/3 of the initial requirement.

HUMIDITY TEST

These capacitors shall meet the humidity test requirements of MIL-STD-202 Method 103B, test condition B. After testing the I.R. will be equal to or greater than 1/3 of the initial requirement.

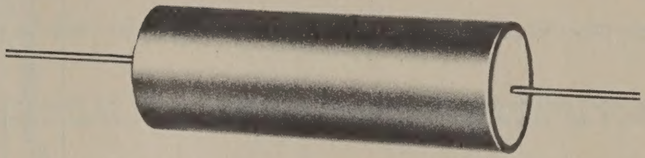
TUBULAR CAPACITORS

HIGH VOLTAGE TUBULAR CAPACITORS DUAL DIELECTRIC/OIL IMPREGNATED PHENOLIC CASED/EPOXY END FILL/TYPE 161



RECOMMENDED APPLICATIONS

Nytronics Type 161 Capacitors are well-suited for use in Oscilloscopes, Electronic Air Cleaners, Power Supplies of industrial devices, and related equipment. The design of these capacitors employs a Paper/Polyester Film Section, oil impregnated, incased in a phenolic tube designed specifically for high voltage application. A unique epoxy endfill process precludes oil seepage which occasionally occurs in similar designs.

OPERATING TEMPERATURE

−55°C to +85°C at full rated voltage.

DISSIPATION FACTOR

Will not exceed 1% at 25°C.

MEASUREMENTS

Capacitance up to 1 microfarad are measured at a frequency of 1000 cycles per second and capacitances over 1 microfarad at 60 cps.

DIELECTRIC STRENGTH TEST

Units will withstand a potential of 150% of rated voltage applied for one minute at 25°C.

STANDARD TOLERANCE

±20%. Other tolerances available on request.

STANDARD MARKING

Nytronics, Part No., Capacitance, Voltage, and Date Code.

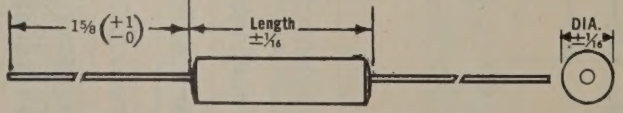
INSULATION RESISTANCE

When measured at the applicable test temperature with an electrification time of two minutes at 500 volts shall be equal to or greater than the values listed below:

Test Temperature	25°C	85°C
Megohms X Microfarads	2000	10
except that the insulation resistance in megohms need not exceed	25000	250

MOISTURE RESISTANCE

These capacitors will meet the moisture resistance requirements of EIA Specification RS-164, which requires units to withstand a 95% Relative Humidity at 40°C, except time of exposure may be increased to 500 hours. After exposure and subsequent drying periods, the insulation resistance will not be less than ⅓ of the initial requirement.



Tinned Copperweld Leads #20 AWG (.032) for sizes to ⅝″ Dia.

POLYSTYRENE FILM CAPACITORS

POLYSTYRENE FILM CAPACITORS HERMETICALLY SEALED TYPE 231 −65°C to +85°C

ELECTRICAL AND ENVIRONMENTAL CHARACTERISTICS

1. CAPACITANCE MEASUREMENTS

Capacitors of 1.0 μF or less shall be measured at a frequency of 1000 Hz. Capacitors greater than 1.0 μF measured at 60 Hz.

Tolerances of ±20%, ±10%, ±5%, ±2%, ±1% are standard. Tolerances closer than ±1% are available upon request.

Reference: MIL-STD-202, Method 305.

2. TEMPERATURE/CHARACTERISTICS AND STABILITY

When measured over the full operating range, the Temperature Coefficient shall be −120 ppm/°C ±30 ppm/°C.

There shall be less than 0.1% change per year in capacitance when operated between +20°C and +50°C. When cycled from −55°C to +75°C, the capacitance shall not vary more than 0.2% from its initial measurement.

3. DISSIPATION FACTOR

When measured as specified in Paragraph 1, the dissipation factor at +25°C shall not exceed 0.1%.

4. INSULATION RESISTANCE

When measured at +25°C, and rated voltage (or 500 VDC, whichever is less), the insulation resistance shall be a minimum of 200,000 megohm-microfarads, but need not exceed 500,000 megohms. The period of electrification shall not exceed two minutes.

Reference: MIL-STD-202, Method 302.

5. VOLTAGE DERATING

The capacitors may be operated at full rated voltage from −55°C to +85°C.

6. VOLTAGE TEST

When tested at +25°C, the capacitors shall withstand the indicated DC test voltages for a period of one minute:

Terminal to terminal	200% of DC rating
Terminal to case	200% of DC rating

Reference: MIL-STD-202, Method 301.

7. LIFE TESTING

When tested at 85°C for 250 hours at 140% of the rated voltage, the capacitors shall exhibit no more than one failure in twelve pieces tested. A failure is defined as:

a) A capacitance change of more than 6% of its initial value;
b) A dissipation factor greater than that specified in Paragraph 3;
c) An insulation resistance less than 60% that specified in Paragraph 4; or
d) A permanent open or short.

8. VIBRATION

The capacitors will meet or exceed the vibration requirements of MIL-STD-202, METHOD 201.

pfc PRECISION FILM CAPACITORS

WHY pfc FILM CAPACITORS ARE UNIQUE

- Conventional pigtails replaced by solid disc termination to achieve minimum inductance, noise, dissipation factor, dielectric absorption and max. strength.
- Core wound to maintain winding integrity.
- Fused at temperatures in excess of maximum operating temperature for ultimate stability and temperature coefficient uniformity.
- Insulation resistance tested 100% at 3 times rated voltage at 85°C.
- Dielectric strength tested 100% at 3 times rated voltage at 85°C for 16 hours.
- Temperature coefficient checked 100% on all zero TC and controlled TC capacitors.

ALL PFC SPECIFICATIONS ARE GUARANTEED LIMITS, NOT "TYPICAL," "AVERAGE" OR "REPRESENTATIVE."

HOW TO SELECT PFC CAPACITORS

PFC capacitor types are identified by a two (2) letter symbol. The first letter signifies the dielectric and the electrical characteristics of the capacitors. The second letter designates the enclosures.

To simplify the selection of the most suitable capacitor for any application the following table is provided showing relative merits of the most pertinent parameters as they apply to capacitors produced by PFC using special designs and techniques.

TOLERANCE: ±5%, ±2%, ±1%, ±½%, ±¼%, ±0.1%.

VOLTAGE RATING: 100 VDCW.

INSULATION RESISTANCE: 10^{13} ohms minimum at 25°C — 10^{12} ohms at 85°C.

DISSIPATION FACTOR: 0.01% maximum at 25°C —0.02 maximum at 85°C.

DIELECTRIC ABSORPTION: 0.05% maximum at all temperatures.

TEMP. COEFFICIENT: Negative 190 ±30 ppm/°C.

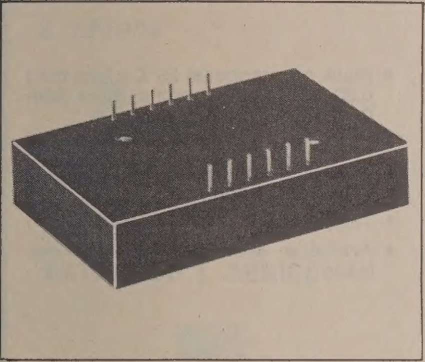
LONG TERM OPERATING STABILITY: ±0.1% maximum drift under fixed or variable operating conditions within specified maximum limits.

In addition to the physical advantages of this design, the electrical excellence of PFC polystyrenes has been retained. High long term stability under maximum operating conditions, low dissipation factor and dielectric absorption, extremely high insulation resistance, close tolerance are featured. And also important is the PFC control of quality which results in close uniformity not only from unit to unit, but from production lot to production lot as well.

The Nickel "A" leads of PFC Type PE capacitors are welded directly to the capacitor section. The strength and permanence of electrical contact is thereby entirely independent of encapsulation.

All PFC Type PE capacitors are "debugged" 100% prior to shipment by accelerated life test at stress levels exceeding ratings to eliminate potential early failures. Extensive data on reliability of PFC polystyrene capacitors is available for documentation.

pfc PRECISION FILM CAPACITORS



precision RC networks

the ultimate in temperature coefficient control of RC product.

linear TC of ±5 ppm/°C over temperature range of −55°C to +85°C.

PFC's ability to produce capacitors with specific and uniform characteristics has facilitated the design of highly precise RC networks. By matching zero temperature coefficient resistors and capacitors, or by balancing temperature coefficient to obtain a zero (or other specified) TC on the RC products, networks which have long term stability independent of temperature are obtained. At the same time RC products of better than ±0.05% accuracy can be supplied. Testing is performed on a 100% basis on both resistors and capacitors with temperature coefficient data recorded at both temperature extremes.

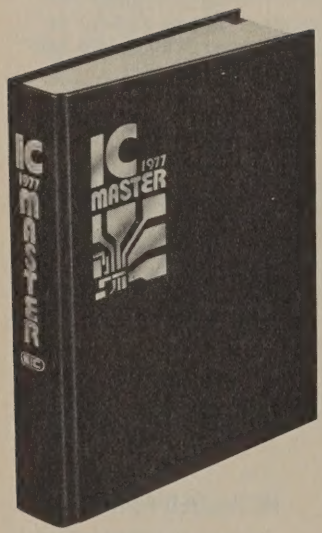
WHEN THE CHIPS ARE DOWN...

THE NEW 1977 IC MASTER PAYS OFF!



The new IC MASTER is the ultimate IC source book.

It lists virtually every IC device manufactured in the United States.

The IC MASTER is the easy, sensible means of narrowing down your IC choices quickly, accurately and systematically. All information is cross-referenced and indexed for rapid problem solving and device selection. And, additionally, the MASTER is updated three times yearly by accumulative supplements.

THE FORMAT OUTLINED:

- **FIVE MASTER SELECTION GUIDES** — 84 companies' IC's organized by type, function, key parameters
- **OVER 1,000 PAGES OF TECHNICAL INFORMATION** — Provided directly by manufacturers covering 17,000 IC's
- **ALTERNATE SOURCE DIRECTORY** — The only industry-wide, pin-for-pin version available
- **MILITARY PARTS INDEX AND CROSS REFERENCE CHART** — Identifies all IC's with JAN qualification
- **MILITARY DEVICE TESTING TABLE** — List companies that screen to Mil. Std. 883
- **MILITARY PARTS INDEX** — The first functional guide to JAN qualified parts
- **PART NUMBER INDEX** — Parts from 84 manufacturers, in numerical sequence
- **APPLICATION NOTE DIRECTORY** — Digest of currently active application note material
- **PRODUCT INDEX** — Provides alphanumeric listing of 84 manufacturers' lines

SPRAGUE CAPACITORS

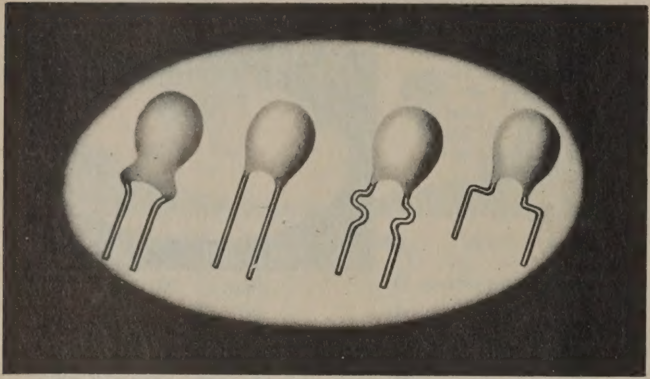
TYPE 199D TANTALEX® RESIN-COATED SOLID-TANTALUM CAPACITORS



Capacitors available in 4 lead configurations. Numbers ending with B1 have hairpin leads with .100″ lead spacing (see first unit on left in photo). Numbers ending with A1 and A2 have straight leads with .100″ and .200″ lead spacing, respectively (second unit on left). For units with formed lock-in leads and .200″ lead spacing (third unit from left), change last letter and last digit in cat. no. to "G2." For outside hockeystick leads (unit on right) with .200″ lead spacing, end cat. no. with "E2." For hockeystick leads with .250″ lead spacing, end cat. no. with "E3."

- Best cost/performance in entertainment and commercial electronic equipment.
- Four lead configurations for easy plug-in mounting on printed wiring boards.
- Priced competitively with any other capacitor of this type, domestic or offshore.
- Maximum impedance in ohms @ 10 kHz guaranteed for every capacitor.
- Lower d-c leakage currents, lower dissipation factor.
- Superior, flame-retardant, moisture-resistant epoxy encapsulant will not crack or chip under temperature extremes.
- Available in all of the popular 20% decade values between 0.1 μF and 680 μF.

SPRAGUE CAPACITORS

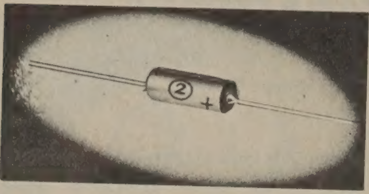
TYPE 150D TANTALEX® SOLID-TANTALUM CAPACITORS



- Hermetically sealed metal case.
- Exhibit stable capacitance and low dissipation factor over temperature range of −80 C to +85 C. With appropriate voltage derating, may be operated to +125 C.
- Listed units have plastic sleeves. For bare case, end Cat. No. in "0" instead of "2."
- Also available as non-polarized capacitors. See Type 151D in Catalog C-563.
- Listed units have capacitance tolerance of ±10%. Capacitors with asterisk (*) are also available with capacitance tolerance of ±20%. For ±20% tolerance, change 9th character in catalog number from 9 to 0.
- For complete technical data, refer to latest issue of Engineering Bulletin 3520.

SPRAGUE CAPACITORS

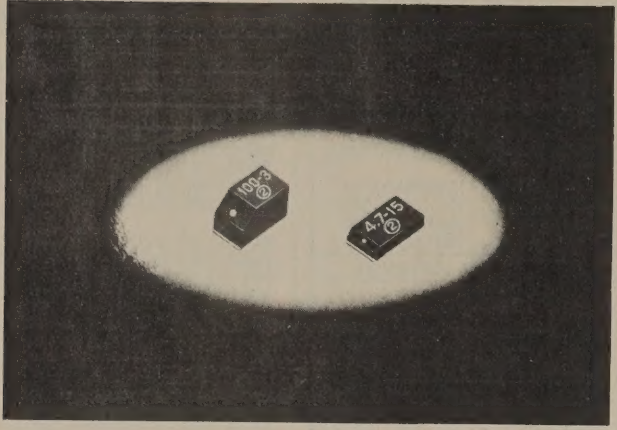
TYPE 193D DOMINO® SOLID-TANTALUM CAPACITORS WITH FLUSH SOLDERABLE PAD TERMINALS*



- Designed for hybrid circuit and low-profile printed wiring board applications.
- Fully-molded construction. Epoxy case provides superior mechanical protection during handling and mounting as well as excellent stability in severe operating and storage environments.
- Leadless design minimizes inductance and saves space. Exposed terminal surfaces on bottom of capacitor. Can be attached to substrates or circuit boards by dip-soldering, welding, re-flow soldering, or other conventional methods.
- Compatible with automatic assembly equipment.
- Low-profile configuration makes Domino Capacitors ideal for use in molded assemblies such as dual in-line (DIP) packages.
- Low d-c leakage, low dissipation factor.
- Capacitance tolerance, ±10%.
- Operating range −55C to +85C. May be operated up to +125C when derated to two-thirds of rated working voltage.
- For complete technical data, refer to latest issue of Engineering Bulletin 3532.

SPRAGUE CAPACITORS

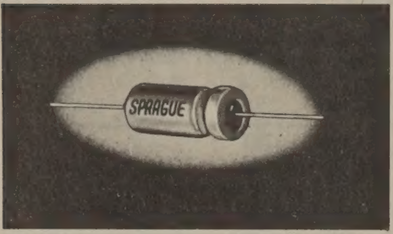
TYPE 109D SINTERED-ANODE TANTALEX® CAPACITORS



- Reliable, superior quality capacitors dual-rated for 125 C and 85 C operation.
- Especially suited for military and critical industrial equipment. Meet 2000 cycle MIL missile vibration requirements.
- Capacitors listed below have plastic-film insulation. For bare metal case, change last digit of Cat. No. from "2" to "0" and subtract .016" from diameter and .063" from length.
- Capacitors listed below have capacitance tolerance of ±10%. For ±20% units, change X9 in cat. no. to X0.
- For complete technical data, refer to latest issue of Sprague Engineering Bulletins 3700 and 3700.2.

SPRAGUE CAPACITORS

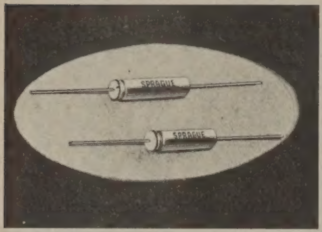
TYPE TE LITTL-LYTIC® ELECTROLYTICS



- Compare! These ultra-small capacitors will withstand a 2000 hr. life test at rated voltage and maximum operating temperature of 105 C.
- Extremely low d-c leakage current, low dissipation factor, high capacitance stability, even after severe high temperature shelf testing.
- Proven dependable performance in industrial as well as entertainment equipment with either transistor or modified electron-tube circuits.
- All terminal connections are welded, eliminating possibility of "open" or intermittent contacts occasionally found in pressure joints of conventional capacitors.
- Ultra-low leakage current
- Metal-encased, with clear plastic outer insulating sleeves.
- For complete technical data, see latest issue of Sprague Engineering Bulletin 3150.

SPRAGUE CAPACITORS

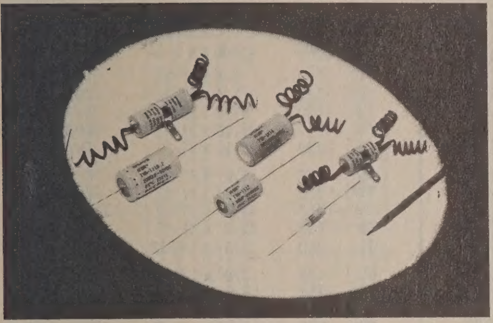
TYPE TVA ATOM® ELECTROLYTICS



- The smallest dependable standard tubular — capacitors to 475V operate up to 85°C (185°F). Higher voltage units designed for 65°C operation.
- Whether for TV sets, ac/dc sets, auto radios, home radio-phono combinations, or other electronic equipment servicing, the Sprague ATOM line will handle all your replacement requirements — no dual inventory problems.
- Low leakage currents, long shelf life.
- Will withstand high temperatures, high ripple currents, high surge voltages.
- Metal case construction with thermoplastic outer insulating sleeve except as noted by † sign.
- Catalog numbers with TVAN prefix are non-polarized, and are ideal for speaker crossover networks. (See listings on 2nd following page.)

NOTE: For the complete line of almost 800 Type TVA Atom Electrolytic Capacitors, including dual, triple, and quadruple-section units, see latest issue of Sprague Catalog C-621 or Sprague Catalog C-563.

SPRAGUE CAPACITORS

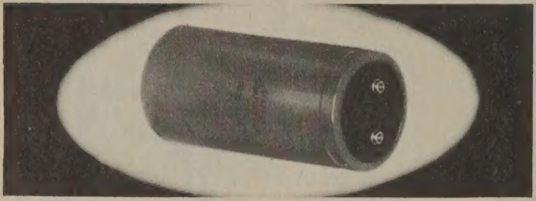
TYPE 32DR COMPULYTIC® ALUMINUM ELECTROLYTICS

MINIMUM ESR - - HIGH RIPPLE CURRENT CAPABILITY



- Designed for long, trouble-free power supply filtering applications in digital computers and allied equipment.
- Low ESR, low impedance . . . as little as ⅓ the ESR of standard capacitors of this type . . . ideally suited for use on the output of a power supply.
- Will safely handle up to 24 amperes of ripple current at 85 C and 120 Hz.
- Superior seal . . . beaded aluminum can is crimped onto rubber gasket recessed in rigid molded cover.
- Case cover has reliable rubber pressure-type safety vent.
- Operating temperature range: −40 C to +85 C.
- Capacitance tolerance: 7.5 thru 50V . . . +75, −10%, 60 thru 100V . . . +50, −10%.
- For complete technical data, including ripple current limits for each rating, refer to latest issue of Engineering Bulletin 3441.

*Capacitors listed have outer plastic-film insulation. For bare case, change 13th character of cat. no. from "2" to "0" and subtract .078" from diameter and .125" from length. Capacitors listed have low-insert terminals. For "special" high-insert or solder-lug terminals, change last character of cat. no. from "A" to "B" or "C," respectively.

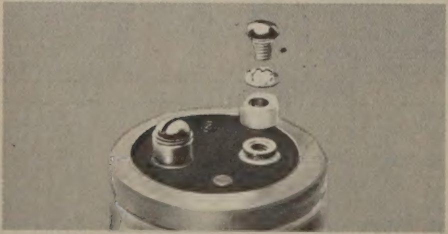
TERMINAL BUSHING FOR POWER-SUPPLY ELECTROLYTIC CAPACITORS



- Converts low screw-insert terminals to high screw-insert terminals on power-supply 'lytic capacitors.
- Made from aluminum and especially tooled to close tolerance dimensions, assuring proper electrical connection between terminal and adapter, eliminating resistance between these two elements.
- The additional 3/16" length on terminals is often required on bus-board applications.
- Packaged 2 to an envelope, complete with washers and screws.

For use with Sprague Capacitor Types:	Dia.	Cat. No.
36D/36DX, 32DR, 602D	Restricted to 1⅜" and 2" only on Type 602D units	75-327

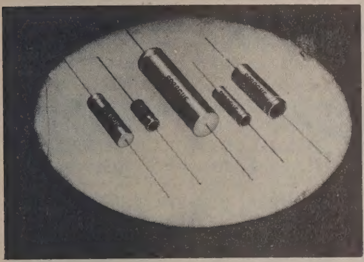
SPRAGUE CAPACITORS

TYPE 39D POWERLYTIC® ELECTROLYTIC CAPACITORS



Designed for applications which require the greatest possible capacitance in small physical case sizes.

- Type 39D capacitors supplement the original Type 36D Can-type Powerlytic line by offering high-capacitance units in axial-lead tubular configuration.
- Welds at all critical anode and cathode terminals eliminate riveted or pressure connections to assure freedom from open circuit even during operation in the microvolt or millivolt signal range.
- Improved molded phenolic end seals.
- Furnished with outer plastic insulating sleeve.
- Operating temperature range, — 20 C to +85 C.
- These capacitors are provided with a pressure-sensitive safety vent.
- Low ESR, low leakage currents.
- Service life, 10 yrs. or more in normal circuit applications.
- For complete technical data, see latest issue of Sprague Engineering Bulletin 3415.

SPRAGUE CAPACITORS

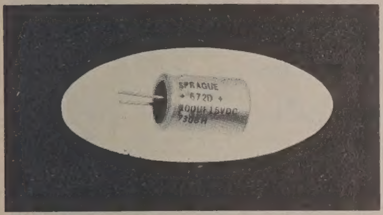
TYPE 672D EXTRALYTIC® ALUMINUM ELECTROLYTICS



- Specifically designed for use in switching regulators and other high frequency applications.
- Miniature single-ended 'lytics feature low equivalent series resistance, inductance, and impedance.
- High capacitance values combined with low inductance and low ESR limits makes these capacitors very useful for bus bar decoupling in data processing applications.
- Premium-grade capacitors offer guaranteed inductance limit of 20nH with typical values of less than 10nH.
- Furnished with outer plastic-film insulation with supplementary polymer coated end-seal.
- Capacitance tolerance, −10, +100%.
- Operating temperature range, −55 C to +105 C.
- For complete technical data, refer to latest issue of Sprague Engineering Bulletin 3452.

TYPE 432D COMPULYTIC® ALUMINUM ELECTROLYTICS

- Revolutionary electrolytic capacitors for ultra-low-impedance applications.
- Impedance limits at 10 kHz are as low as .001 ohm, with typical values of only half the specified limits.
- Special strip-line terminals are ideal for use with laminated-bus power distribution systems found in modern EDP equipment.
- Stacked-foil construction allows capacitance values to 100,000 µF with extremely low ESR of typically less than .001 ohm and inductance of only 1 nH.
- Operating temperature range, −40 C to +85 C.
- For complete technical data, refer to latest issue of Sprague Engineering Bulletin 3443.

SPRAGUE CAPACITORS

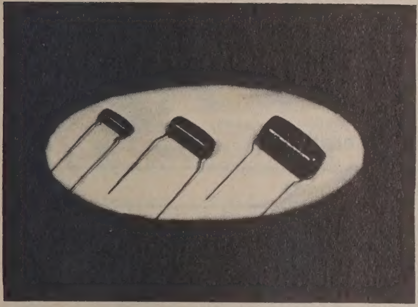
TYPE 715P FILMITE® 'L' ORANGE DROP® DIPPED TUBULARS



- Polypropylene film capacitors similar to polystyrene units with their high a-c current-carrying capability, but have added advantage of operating temperatures to 105 C and extremely low dissipation factor.
- Ideal for applications where high a-c current flow is found, as in certain solid-state TV vertical circuits, r-f generators, and pulse-forming networks.
- Exhibit capacitance change of less than 3% over entire operating temperature range.
- Temperature coefficient is negative and virtually linear at 180 ppm/°C over the temperature range of +25 C to +105 C, making capacitors suitable for matching with positive TC resistors and inductors to maintain circuit stability.
- Conformally coated with flame-retardant epoxy which also provides protection from humidity and mechanical damage.
- Capacitance tolerance, ±5%.
- Furnished with 1.250" long "hockeystick" crimped leads.
- For complete technical data, refer to latest issue of Engineering Bulletin 2090.

HYPERCON® CERAMIC DISCS

- Superior to electrolytic capacitors of similar capacitance values due to very low power factor.
- Ultra-miniature . . . ideal for use in transistorized circuitry.
- For bypass and coupling, but particularly well-suited for any low-voltage use where high capacitance and low power factor are important.
- For complete technical data, see latest issue of Engineering Bulletin 6141.

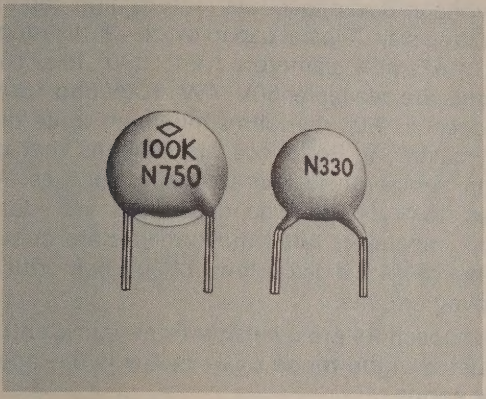
temperature compensating

type 2ddt



Centralab's temperature compensating disc capacitors offer drift free performance. Variations in operating temperature cause a predictable linear capacitance change. This change is called temperature coefficient of capacitance and is expressed in parts-per-million-per-degree C (ppm/°C). Maximum dissipation is 0.2% with insulation resistance rated at 20,000 megohms minimum. Temperature coefficients include NPO, N080, N150, N330, N470, N750, N1500 and N3300. Typical applications are tuned circuits and RC networks.

A complete line of temperature compensating disc capacitors is available from your Centralab Distributor.

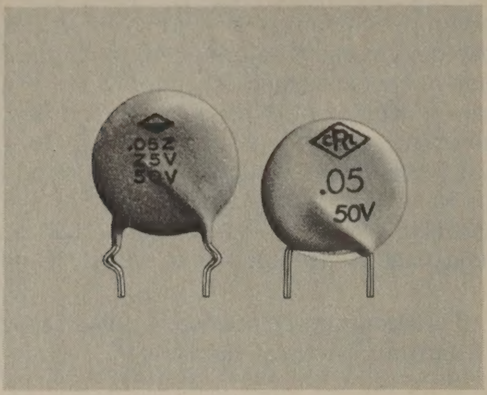
general purpose—low voltage



Centralab's low voltage disc capacitors feature high capacitance density for their size. Typical capacitance values range from .005 μF to .1 μF with diameters from .390" to .718". Four voltage ratings are available: 50V, 75V, 100V and 150V. Insulation resistance is 7500 megohms minimum while dissipation is 2.5% maximum. For those applications that do not require a tight temperature characteristic, such as the Ultra-Kap® series, low voltage disc capacitors are ideal. These economical capacitors fulfill most solid state circuit requirements. Applications include low voltage non-critical bypass and coupling circuits.

monolithic ceramic capacitors

testing during manufacture

The following tests are conducted by USCC on all dielectric lots. These tests are monitored or conducted by the Quality Assurance Department to insure that appropriate specifications are followed and established test limits are satisfied.

CAPACITANCE

The capacitance of each unit is checked on a 100% basis for most tolerances and by AQL sample for broad tolerances to assure high yelds and final component stability. Test conditions are 1 VRMS ±.25 VRMS for COG, X7R, "J" and "S" dielectrics, .1 VRMS for Z5U, Y5V and "R" dielectrics. USCC offers tolerances from ±0.5 pF to GMV, depending upon dielectric.

DISSIPATION FACTOR

Whenever capacitance is checked, dissipation factor is monitored to assure that a maximum limit of .1% for "J", .15% for COG, 2.5% for X7R, Z5U, Y5V, "R" and "S" dielectrics are not exceeded. Test conditions are 1 VRMS for COG, X7R and "J"; .1 VRMS for Z5U. Y5V. "S" and "R" dielectrics. At 1 VRMS, "S" dielectric will meet 3.5% maximum.

DIELECTRIC STRENGTH

Each unit is tested for dielectric strength to eliminate random inconsistencies introduced in processing. The test is a minimum of 250% of rated voltage for COG, X7R, "J" and "S" dielectrics and 200% of rated voltage for Z5U, Y5V and "R" dielectrics, the charging current is limited to less than 50 ma.

INSULATION RESISTANCE

An AQL sample is tested to qualify production lots. This test insures that the insulation resistance exceeds the lesser of 100,000 megohms of 500 megohm-microfarads for X7R, Z5U, Y5V, "J", "S" and "R" dielectrics and 100,000 megohms or 100 megohm-microfarads for COG dielectric. Measurements are made with a megohm-meter (General Radio 1862C - typical), allowing a two minute maximum charging time. Capacitors are tested at their rated voltage.

hi-reliability testing

Although the parts listed in this catalog are recommended for high volume usage, they are manufactured on the same production line as all USCC high-reliability capacitors. USCC performs high-reliability screening on a significant number of all orders shipped. This screening ranges from Group A, B and C testing in accordance with MIL-C-39014 or MIL-C-11015, to specialized customer test requirements. The following test sequence is available on all USCC capacitors and chips at very little additional cost. To order, simply add the prefix letter "R" to the standard part number; e.g., RC40C103K. All parts ordered with this prefix will automatically receive the screening tests listed below.

Test	MIL-STD-202 Method	Condition	Test Conditions	Requirements
Thermal Shock	107	B	Exposure at Temperature Extremes shall be 30 minutes.	No mechanical damage.
Burn-in (Voltage Conditioning)	108	A	200% of rated voltage at +125°C for COG, X7R, J and S dielectrics, 150% of rated voltage at +85°C for Z5U, Y5V and R dielectrics; for 96 hours.	N/A — Screening tests removed all defective parts.
Dielectric (Withstanding Voltage)	301	—	COG, X7R, J and S dielectrics — 250% of rated voltage with 50 ma maximum charging current. Z5U, Y5V and R dielectrics — 200% of rated voltage with 50 ma maximum charging current.	No evidence of arcing or breakdown.
Insulation Resistance	302	—	Rated voltage applied for 2.0 minutes maximum.	X7R, Z5U, Y5V, J, S and R dielectrics — 100,000 megohms or 500 megohm-microfarads. COG dielectric — 100,000 megohms or 100 megohm-microfarads whichever is less at +25°C.
Capacitance	305	—	COG, X7R, J and S dielectrics — 1.0 VRMS ±.25 VRMS and 1 kHz; Z5U, Y5V, R and S dielectrics — 1 VRMS and 1 kHz.	Within purchase tolerance.
Dissipation Factor	305	—	COG, X7R and J dielectrics — 1.0 VRMS ±.25 VRMS and 1 kHz; Z5U, Y5V and R dielectrics — .1 VRMS and 1 kHz.	Within purchase specifications.

Screening of this type is an extremely effective means of eliminating infant mortalities. Summary data is provided for all tests. Due to its relative simplicity, the cost of this testing is quite low.

SPECIFICATIONS

DIELECTRIC WITHSTANDING VOLTAGE

200% of rated voltage applied through a minimum limiting resistance of 100 Ohms/Volt. Duration of voltage stress shall be 15 seconds minimum and 1 minute maximum at 25°C.

TEMPERATURE RANGE

−55°C to +85°C with full rated voltage applied. To +125°C with 50% of rated voltage.

INSULATION RESISTANCE

At 25°C after 2 minutes of electrification at rated voltage or 500 VDC, whichever is less, the minimum product of Insulation Resistance and Capacitance shall be 100,000 megohms-microfarads, but need not exceed 100,000 megohms.

DISSIPATION FACTOR

Shall not exceed 0.75% when measured at 25°C and 1000 Hz, ±20 Hz. See characteristic curves for D.F. ratings at other temperatures.

CAPACITANCE AND TOLERANCE

Shall be measured within the tolerance limits specified. Measurements will be made at 25°C and 1000 Hz ±20 Hz.

LIFE TEST

Shall withstand 140% of rated voltage at 85°C for 250 hours. One failure in twelve shall be permitted.

CAPACITANCE STABILITY (DRIFT)

Less than 0.50% when measured in the following manner: three capacitance readings at 25°C, each made prior to and after temperature cycling from room to 80°C, and room to −55°C. The mathematical difference between the two extremes, divided by the intermediate value, and then multiplied by 100, yields the stability expressed in percent.

HUMIDITY RESISTANCE

Meets requirements of Mil-C-27287,, Para. 3.12 when tested in accordance with Mil-STD.-202C, Method 103 B, Condition B.

LEAD PULL AND BEND TEST

Steady pull of 5 pounds applied axially to leads for one minute. Bend test shall consist of one bend from the point of egress, first 90° in one direction, back to the original axial position, and then 90° in the opposite direction with no evidence of breakage.

FEATURES

Wrap and fill construction.
Tubular or oval configuration for optimum space savings.
Extended foil design.
Quality control procedures per Mil-Q-9858.
Will meet or exceed Mil-C-27287.

SPECIFICATIONS

DIELECTRIC WITHSTANDING VOLTAGE

200% of rated voltage applied through a minimum limiting resistance of 100 Ohms/Volt. Duration of voltage stress shall be 15 seconds minimum and 1 minute maximum at 25°C.

TEMPERATURE RANGE

−55°C to +85°C with full rated voltage applied. To +125°C with 50% of rated voltage.

INSULATION RESISTANCE

At 25°C after 2 minutes of electrification at rated voltage or 500 VDC, whichever is less, the minimum product of Insulation Resistance and Capacitance shall be 30,000 megohms-microfarads, but need not exceed 30,000 megohms.

DISSIPATION FACTOR

Shall not exceed 1.0% when measured at 25°C and 1000 Hz, ±20 Hz. See characteristic curves for D.F. ratings at other temperatures.

CAPACITANCE AND TOLERANCE

Shall be measured within the tolerance limits specified. Measurements will be made at 25°C and 1000 Hz, ±20 Hz.

LIFE TEST

Shall withstand 140% of rated voltage at 85°C for 250 hours. One failure in twelve shall be permitted.

CAPACITANCE STABILITY (DRIFT)

Less than 0.3% when measured in the following manner: three capacitance readings at 25°C, each made prior to and after temperature cycling from room to 85°C, and room to −55°C. The mathematical difference between the two extremes, divided by the intermediate value, and then multiplied by 100, yields the stability expressed in percent.

HUMIDITY RESISTANCE

Meets requirements of Mil-C-27287, Para. 3.12 when tested in accordance with Mil-STD.-202C, Method 103 B, Condition B.

LEAD PULL AND BEND TEST

Steady pull of 5 pounds applied axially to leads for one minute. Bend test shall consist of one bend from the point of egress, first 90° in one direction, back to the original axial position, and then 90° in the opposite direction with no evidence of breakage.

WESCO® POLYSTYRENE CAPACITORS

SPECIFICATIONS

DIELECTRIC WITHSTANDING VOLTAGE

200% of rated voltage applied through a minimum limiting resistance of 100 Ohms/Volt. Duration of voltage stress shall be 15 seconds minimum and 1 minute maximum at 25°C.

INSULATION RESISTANCE

At 25°C after 2 minutes of electrification at rated voltage or 500 VDC, whichever is less, the minimum product of Insulation Resistance and Capacitance shall be 500,000 megohms-microfarads, but need not exceed 500,000 megohms.

DISSIPATION FACTOR

Shall not exceed .05% when measured at 25°C and 1000 Hz, ± Hz. See characteristic curves for D.F. ratings at other temperatures.

CAPACITANCE AND TOLERANCE

Shall be measured within the tolerance limits specified. Measurements will be made at 25°C and 1000 Hz, ±20 Hz.

LIFE TEST

Shall withstand 140% of rated voltage at 85°C for 250 hours. One failure in twelve shall be permitted.

TEMPERATURE COEFFICIENT

Capacitance shall change linearly over operating temperature range at rate of −105, ±30 parts per million/°C.

CAPACITANCE STABILITY (DRIFT)

Less than .05% when measured in the following manner: three capacitance readings at 25°C, each made prior to and after temperature cycling from room to 85°C, and room to −55°C. The mathematical difference between the two extremes, divided by the intermediate value, and then multiplied by 100, yields the stability expressed in percent.

HUMIDITY RESISTANCE

Meets requirements of Mil-C-27287, Para. 3.12 when tested in accordance with Mil-STD.-202C, Method 103 B, Condition B.

LEAD PULL AND BEND TEST

Steady pull of 5 pounds applied axially to leads for one minute. Bend test shall consist of one bend from the point of egress, first 90° in one direction, back to the original axial position, and then 90° in the opposite direction with no evidence of breakage.

TEMPERATURE RANGE

−55°C to +85°C with full rated voltage applied.
